I have a Radio Shack Scanner Pro-26 Hyperscan with 200 channel programable cabability, The Radio is not even a year old, I bought it with an extended warranty Policy, should the scanner have any problems, all you do is bring it back to your local Radio Shack and the Company has the say so to exchange or just replace with a new one.

I'm, ofcourse very reluctdant to get rid of it because I was in the Block watch program in my neighborhood and it help me catch a lot of bad guys and at the say time gave me countless of hours of enjoyment and excitement. The scanner has a high frequency of up to 1.3 GHz so you can listen from anything to your favorite radio station, News or T.V. station WFM band NFM band AM, FM, police, goverment, detectives, etc....I also have the frequency latest guide book I will throw in the deal, My business is growing and I need more Hard drive space at least 3 or more gigs no less, or to purchase a hard drive, now Im not necessarily saying I will trade straight across, because the scanner is a high quality piece of electronics which Will last for many years to come, I still have my 7 yr old scanner which at that time didn't pick up and trunked frequencies, but I am willing to deal with someone who those have a newer Hard drive of the specifications Im looking for.

Im asking for A good quality Hard drive capable of least 3.gigs.
The scanner comes with a special ordered leather custom fit sheath.

please E-mail me if interested to believe@doitnow.com

Thank you

Sincerly Bill

:-)
p.s.

An Addedem to the doc letter, I'm willing to wheel and deal becuse the need of the hard drive is getting a bit in the rush catagory, if you got a deal or offer I can't refuse, well then by all means throw it my way,....please E-mail with a offer...I will get back to you as soon as possible.

Thank You

I live in the DC area and am constatly seeing Marine 1 and Marine 2 the helicopter used to move the Pres and other dignitaries about as well as the helicopters that escort them. The freqs that I have for this fleet seem to be bogus. I am sure that when the Pres is aboard they are encryypted but these helicopters are flying all the time and must have commuication with some base or tower, so I don't think these freqs are good: 46.75,46.7,46.8,34.35,375.00,142.75,265.8

Does anyone have any other freqs they know about?

Thanks

Does anyone know if it is possible to program a Motorola 800mhz trunked mobile or handheld to receive local public safety?

Is programming equipment and software available, or does anyone offer this servicer?

It would strictly be for receiving only, no transmitting frequencies would even need to be inputted to the radios. Both radios are set up on a private trunked 800 system.

I read somewhere that the "memory effect" of nicads is absolutly false. It is like an "Urban Legend" type of thing that refuses to die.
This "effect" was observed on a space mission on one defective nicad cell, and thats where it all started. I think other occuring defects are misinterpreted as "memory effect".
I will probably get blasted for writing this.

:>price.
:>

I've been shopping around and the best price I've found is US$588 at EEB (800-368-3270). They have a web site at http://www.access.digex.net/~eeb. Grove (http://www.grove.net/hmpgcat.html) is in the same ballpark at US$599. Radios from both of these suppliers will be cellular blocked. Grove will unblock after purchase for something like $40 plus return shipping.

Javiation (http://www.demon.co.uk/javiation/) and Durham (http://www.osha.igs.net/~durhamradio/) sell unblocked radios, but you'll be on the hook for import duties (I have no idea how much) if you're in the U.S. The prices at both Javiation and Durham are also higher than EEB or Grove.

Good luck and good listening.

Lorin-

It is a good counter for the price, but it may not be the item you
are looking for. Optoelectronics manufactures a few frew-counters that
are specifically for observing someone on a radio and tuning into them.

The Radio Shack counter is meant for bench work.

Steve

20. Proper Grounding!!

Newsgroup: rec.radio.scanner

From: rd <rld1234@erols.com>
Message-ID: <32F34C70.131F@erols.com>
Source record: 209281

I'm sure this is basic info but would appreciate info
as to reading material and/or web sites as to the proper way of
'grounding' the antenna/lead in coax when using a 'discone' scanning
antenna.

Summers here see a fair amount of thunder storms. This antenna will be
no higher that 8' to 10' feet above the roofline.

Thanks.

Rich,

What you are describing is not memory effect! It is nothing more than
symptoms of improper charging/discharging, reduced capacity and/or the
gradual decline of a ni-cad in terms of life vs capacity. No used Ni-Cad
will have the capacity it had when it was new after time and use.

Try putting them through an analyzer (such as an Alexander) and note the
results. I do this all the time in my job. REAL professionals don't resort
to light bulbs and chattering relays, we use the proper charge/discharge
routine in equipment made exclusively for Ni-Cads and get an actual ampere
hour capacity reading.

The Gates battery engineer who wrote the article in Mobile Radio
Technology a few years ago (I don't remember the issue) was one of the
developers of Ni-Cads. He's the one who rebuked this nonsense of memory
effect. You are still going to argue with THE authority on Ni-Cads?

Let the damn thing die already!

Source record: 209285

I know there's a code for the Pro-51, but the date code on the scanner has to be below a certain number for it to work. I don't own a Pro-51, but a friend bought one about Aug.96, and we tried the trick. It put in factory frequencies, but no cell freqs. like the trick described. *try searching 898-920 MHz, you might be suprised!*

Sounds like some nice onfo to have in a book sold to radio hobbyists,
etc.

> I would appreciate any assistance you could provide. It is my hope
> that the public will benefit from my efforts, and that you will benefit
> if the need arises.

How will you benefit from the efforts and assistance you're asking
other people to provide you?

I have spent two years laying the groundwork for
> this undertaking, and I have the resources, equipment, time, and desire
> to make it happen. The only thing missing is the information. I have
> thousands of pages of material already, but it is not enough.

So in your market research, you decided that FEMA's old Portable
Emergency Data System (PEDS, available to all agencies involved in
emergency management) wasn't good enough?

> With your
> help, and the help of those like you, we may just save a life.

How melodramatic...

ZBM2 means, "Put a competent operator on watch on this frequency." I
often wondered whether it was significant that it was thought necessary
to include an operating signal for this sentence.

30. RE: "Family Radio Service"

>>Does anyone out there know the current situaiton with the "family
>>radio service"? i.e.:

NEWS Report No. DC 96-44
ACTION IN DOCKET CASE
May 14, 1996

FCC ESTABLISHES A FAMILY RADIO SERVICE
(WT DOCKET NO. 95-102)

The Federal Communications Commission (FCC) amended Part 95 of its Rules to establish a new personal radio service -- the Family Radio Service. This service was created in response to a petition filed by the Radio Shack Division of Tandy Corporation, requesting that the Commission establish a new radio service aimed at providing the American public an affordable and convenient means of direct, short range two-way voice communications among small groups of persons.

The Family Radio Service (FRS) is a short distance (approximately a couple hundred yards to a half mile), two-way personal radio service. Its purpose is to provide families, friends and/or associates participating in group outings a way to communicate with members of the group who are out of speaking range or sight but still in the same general area. For example, the FRS could be used by hunters, campers, hikers, bicyclists and other outdoor activity enthusiasts to keep in contact with one another. It could also be used by parents to keep in touch with children playing in the neighborhood or families or friends to keep in contact with one another while at shopping malls, sporting events, amusements parks, etc.

The FCC rules authorize a user to operate an FCC certified FRS transmitter without a license in places where it regulates communications. The FCC certified FRS unit may be identified by the label placed on it by the manufacturer. The radios transmit on any of the fourteen 462-468 MHz channels allocated to FRS.

Action by the Commission May 10, 1995 by Report & Order (FCC 96-215). Chairman Hundt, Commissioners Quello, Ness and Chong.

ATTENTION to Details BBS is currently offering these Amateur Radio-related files via its free FTP service:

KEYWORD DESCRIPTION
==========

MAC-HAM List of 75+ Amateur Radio-related files for the Mac available on ATD BBS. 10K/TEXT

NECUTILS Those infamous, difficult-to-locate NEC laptop setup utilities. 17K/ZIP

NICADS Informative article on the care and discharge/charging cycles of NiCad batteries. 14K/TEXT

RFI-TELEPHONE ARRL FAQ dealing with RFI and telephones. 22K/TEXT

WRC-97 As long as the threat to 2M and 440MHz continues, we will update this information package of texts relating to the "Little LEO / WRC 1997" issue. 29K/ZIP

HELP Returns text File with all active KeyWords. 12K/TEXT
==========

How to Use the FTP Server at ATTENTION to Details BBS

The ATD BBS FTP Service is offered as a cost-effective means to obtain information and files from our Bulletin Board System (BBS) - using Internet E-Mail as the method of exchange. Using our FTP Server is as simple as addressing an Internet E-mail message to

ftp@atdbbs.com

containing one or more KeyWords. Multiple KeyWords can be combined in a single Message - but it is very important that there be only ONE KEYWORD PER LINE!

EXAMPLE: You see from the above list of KeyWords that you want a copy of our textfile on NiCad batteries and our Help file. Address your Internet E-Mail...

TO: ftp@atdbbs.com
SUBJECT: [anything here is OK]

...and write the corresponding KeyWord, NICADS, as the ONLY word in the FIRST LINE of your message. And write HELP on the SECOND LINE of your message. That's all there is to it!

ATTENTION to Details BBS Sysop: Clint Bradford

Sounds bogus to me. If a handheld unit could cause this, why not all
the higher powered cell sites located near the airport, etc?

>Pretty scary stuff, huh?

What's scary is thinking about airliner systems so poorly designed
that random RF could cause a major malfunction.

Sorry to burst your bubble, but the people telling you that the
"memory effect" is a myth are correct. The "memory" thing has become
an Urban Legend which is repeated almost everywhere by people who
don't know any better, or by charlatans selling "battery
conditioners," but the evidence shows otherwise.

> I work for a a National broadcasting service and I work with Nicads for

And you're just throwing away money by using up recharging cycles by
bleeding those batteries.

You suggest:

>http://home.sprynet.com/sprynet/lar01/nicad.htm

and then, to find the real truth, read:

http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_NiCd_Memory.html

and follow the links for more information.

Wow! Optoelectronics is out of business!? I guess yesterday I was talking to some unemployed ghosts who crufted together an OS535 interface for me. :)

Just kidding. As far as I know, they are still in business. I bought a 535 last week, and called them yesterday (Friday the 31st) with a question about it. They were there, and helpful. You might want to just deal with them directly... Their number is 1-800-327-5912

Sincerely,
Robert McIntyre

39. Re: Digital Police Radio

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: akeem1@aol.com
Message-ID: <19970201224400.RAA14698@ladder01.news.aol.com>
Source record: 209300

In article <32F17CB4.7164@accessnv.com>, Larry <lhunt@accessnv.com>
writes:

>Pull your head out of the sand, when all police radios go digital in the
>near future you can throw away your $200.00 to $400.00 scanner. That
>will be the end of scanners.
>
>

No, no matter the technology, We will and always do find a way around to
get
to what ever it is we are after. The trend will follow, Costly at first,
till all jumps
on the band wagon, prices fall, and you get your 400/200 dollor scanners
back.

41. Re: cell phone freqs

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: Sean Wagle <not.my@real.addr>
Message-ID: <01bc108d$4cffd8c0$c8111d26@default>
Source record: 209302

> could someone please send me the freqs where I would find cell >phones?
I am using a bc200xlt. Would I be able to get these >freqs on this unit?

Sheesh. How many days a week does this get asked? Maybe we
should have a 'bot post them every day!

>>
>> Let the damn thing die already!

It'll never die. There are too many folks who should know better
repeating it. I recently saw two articles in one issue of Nuts &
Volts that mentioned "memory effect." It doesn't help that there are
lots of crooks selling "battery conditioners" to kill off your
batteries faster by discharging them every time you charge them.

Besides, the myth helps to sell a lot more batteries, both nicads and
competing types. Personally, for stuff that doesn't get heavily used
every day, I've started using Renewal alkalines. Since they have far
more capacity than nicads, and don't self-discharge nearly as fast, I
get better service than from nicads.

That is some scanner inventory, I thought i had alot.Any idea how to put a remote scan button on a pro-2006.(so you can make it scan to the next cell call without getting up or reaching for the scanner)? I thouht i heard this can be done, just not sure how.Like mabey running a wire from the circut board with a small switch on the end.Thanks alot,
Dan9125@aol.com

Well, rest assured, our product has no such limitations.
Anything your PRO-2006 can presently monitor you will be
able to 'work with'. Interface designs to other popular
scanners are also in the planning stages.

Each day we receive feedback and suggestions. One such
suggestion was why not make use of the OS456 (etc) interfaces
available for the PRO-2006. This is a good idea too. The cost
of our unit plus the OS-456 though is beyond most peoples
budgets but we will be producing a unit that will work with
an existing OS-456 for those folks who have already purchased
(or contemplate purchasing) an OS-456.

To all those who have e-mailed with inquiries we are still
diligently at work getting this thing "out of the lab" and
into "production".

In article <32f3b4c8.7448864@news.cyberhighway.net>, Glen Quarnstrom
<glenq@NOSPAM.cyberhighway.net> writes
>Sounds bogus to me. If a handheld unit could cause this, why not all
>the higher powered cell sites located near the airport, etc?
Because the vulnerable equipment is located *inside* the aeroplane.
Apart from windows etc, this equipment is screened from external
sources. Besides, cell sites are predictable and allowance can be made
in the relevant places.
>
>>Pretty scary stuff, huh?
>
>What's scary is thinking about airliner systems so poorly designed
>that random RF could cause a major malfunction.
So why risk it? Surely you can do without your radio equipment for a
while, especially trivial stuff like scanners.

52. PRO-2006 "Tape out" question

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: "Zurab G." <zurab@together.net>
Message-ID: <32F44731.67A9@together.net>
Source record: 209313

Hi,

I want to take a signal from RS-2006 tape out for the Pager decoder
circuit. This circuit appeared in "Popular Electronics" March 1997 issue.

My question is: Does this output contain unfiltered
signal? this decoder circuit needs square-wave signal, which after
filtering loses it's shape. If "tape out" is filtered too,
does anybody know where to pick a "pure" signal on the 2006 PC-board?

Thanks,
Zurab.

P.S. please, respond via e-mail too.

To be _absolutely_ correct (you want to be correct,
don't you?) this should be updated to state that
"AMPS (Advanced Mobile Phone Service - AKA standard
'Cellular') is FM Channels ... blah blah blah" as
CDMA and TDMA are becoming widespread across the US
of A.

Jim

Although laptop computers and other electronics are usually allowed on flights, they are only allowed when the announcement is made. This is usually only when in flight, and almost never during takeoff, or approach.

More specifically, any radio device is rarely allowed in a passanger plane at any time. This is important because the body of the aircraft may act as an antenna or house the cables that route to sensitive equipment and aircraft antenna systems. While it is true that the same frquencies are existing outside the plane from broadcsast stations, cell phones and cell cites, and paging towers, the fact of the matter is that these radio broadcasts do not exist at the high field strengths within the aircraft that a local source of RF would create.

Most FM radios, when tuned to the high side of the band have the internal local oscillator emitting radiation smack dab in the aircraft band, also scanners have local oscillators that emit radiation of varying frequencies all over the place.

Why computers, nintendos, and other non-radio devices which still emit stray RF ARE allowed, I do not know.

Just my .02 worth. by the way.. I am no expert on airline and FAA regs by any means whatsoever.

55. Re: Digital Police Radio

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: Mike Harpe <mike@mharpe.win.net>
Message-ID: <32F41080.41C67EA6@mharpe.win.net>
Source record: 209316
Cross-posted to: rec.radio.scanner,alt.radio.scanner

This argument about digital scanning gets old. There WILL be digital scanners someday. I remember reading on this very newsgroup sage and wonderful advice from self-proclaimed "experts" saying there will never be trunk-capable scanners. Well, guess what! There will trunk-capable scanners available in March, folks. Any Joe with a Visa card will be able to buy one. Digital will go the same way.

It's a market economy, people. If there is demand for something, someone will provide it. This stuff about police agencies wanting to do away with scanners is just crap. Oh sure, you might have a few wackos who think they are in some sort of apocolyptic world where everyone wants to kill them and that scanners let them do this. Most police officers I know do not care one way or another about scanners.

Digital is spectrum-efficient and spectrum is getting tight. It's not just about security. The people that really want security, Narcs, for example, use encryption. The people who say that budgets are tight are right. That's why I think APCOA 25 (is that what it's called?) is crap. Most departments can barely keep cars that run. It'll be 10 years at least before you have even 50% market penetration.

I think it would be fun to reverse engineer one of the GE Voice Guard radios and run the encryption through a brute-force decoder. I think you would be surprised how weak the encryption is. I'd also be willing to bet that a typical department almost never changes the keys on the radios. Hell, you can't even get people to change passwords to computer accounts, let alone reprogramming hundreds of radios with new keys. I wonder what the export restrictions on Voice Guard radios are?

Relax. You'll just have to buy a new scanner.

56. 143.675 -New phone patch for NJ?

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <1FEB97.16482905@shrsys.hslc.org>
Source record: 209317

For some time now I've been hearing phone calls on 143.675. I've entered this on several radios with different IF's (also double & triple conversion) so I know it's really there and not an image. The conversation is always in Spanish which I don't speak, so I can't get a read on what type of context it is. The conversation sounds very informal however so I don't think it is business or Govt. related. I'm in northeast, NJ. Any ideas??
Phil

We just started using the new digital radios from Motorola. A few units are currently issued in Richmond, Brooklyn & Queens, one base in each boro. The units can be used city wide, local talk groups, and private (unit-to-unit). The radio also has built in digital cell phone, and alpha pager. It a just a little bigger than my pro-39. In fact a tri-state communication test was conducted, NY, NJ, CT, and even a part of PA (Poconos) there was not problems communicating between units (unit-to-unit and unit-to-base).
I've been using scanners for years, when not at work I like to listen in. I tried to search. No luck, what I been told it uses spread technology, and spread over a wide range of frequencies. If I were able to receive the signal, it would sound something like a modem. Also the radios use cell sites placed throughout the metro area, as well as being able to use commercial cell sites. And on a negative side for the user, the user location can be tracked within 100 feet. So far the radios are given thumbs-up, and it may not be long before everyone will be using them.

$ASTRO (tm) employs an entirely different modulation scheme. it can be
$employed on 12.5 khz bandwidth channels or 25 khz channels.
$The structure of the signalling word is proprietary to Motorola. It
$permits a host of functions. the least of which is embedded error
$correction. Encyption (DES, DVP, or their XL variants, or other
$unmentionable crypto options can be layered on top of it).
$The MSF series bases are discontinued, they have been replaced with
$Quantar/Quantro(tm) bases. Check out 'http://www.mot.com' for
$further info. A 'secure capable' channel probably means , it has
$the infrastructure support for secure voice (ie. Digitacs, CIU's, etc)
$Assuming it's a 'wide area' system.

Source record: 209392
Cross-posted to: alt.radio.scanner,rec.radio.scanner

"Section 302(d) of the Communications Act, 47 U.S.C. Section 302(d),
prohibits the FCC from authorizing scanning equipment that is capable of
receiving transmissions in the frequencies allocated to domestic cellular
services, that is capable of readily being altered by the user to intercept
cellular communications, or that may be equipped with decoders that convert
digital transmissions to analog voice audio. "
(http://www.fcc.gov/investigation.html)

Does the last section in this statement mean that they (the FCC) will not
authorize scanners that will be capable of receiving APCO 25 compliant
transmissions, or systmes like Motorola Sabre?

If this is the case, the future of scanning looks most bleak.

Comments, anyone?

From: cmf@iquest.net
Message-ID: <32f4b44c.87374272@nntp.iquest.net>
Source record: 209393

Greg Renner and I finally had the opportunity to exchange e-mail and discuss what had lead to my posting "Beware: Greg Renner" in this newsgroup. It appears that Greg's ISP was in the process of switching their e-mail addresses and all of my replies to Greg had gone to his old e-mail address which he never received, thus leaving me to believe that he had abandoned the purchase of my radio. I do wish that Greg would have forwarded his new e-mail address to me so all of this could have been avoided! Anyway, in closing, I would like to retract all statements made by me and directed toward Greg Renner which may have portrayed him as being less than honest, or fair dealing and to offer a public apology for any grief or hardship my comments may have caused him.

Most Sincerely,

Michael

Source record: 209394

Stephen,

This may sound funny, but did you try engaging the attenuator. You may be experiencing desensitization from an extremely strong signal. That can be a problem with the 9000, an outside antenna and a nearby transmitter. If so, the attenuator may reduce the signal strength and allow the radio to handle it ok.

Also, did you check to make sure you were in NFM mode?

John

<scott@comp1.cc.wm.edu> says:
>
>Lately I have been hearing the local police respond with the term QSL. It
>appears that the response is just another way of answering in the
>affirmative. But what does it mean?
>
>
>Scott
>

Although N2QAY probably know more about this than I do (I have only operated
on 2 meters, and that for only about 3 months), Postcards called "QSL Cards"
also are exchanged by hams (and SWLs get into the act too by submitting reports)
to confirm a conversation.

QSLs are used to backup logs during contests and such. Some are also pretty nifty
looking, aswell (atleast the ones I have seen).

By the way, does anyone know if QSLs are ever exchanged on 6 meters? 2? 440?
10? Just curious...

Yes, the future for PUBLIC SAFETY monitoring with police scanners is bleak. That's why, if you're interested in keeping your local law enforcement open-broadcasting per community interests, you best promote open broadcasting in your area *immediately*. It may not necessarily involve "police scanners", but there are other things agencies can do to make sure the public can still listen in.

In 30 years, digital systems are going to be the norm. It won't even be fair to call "police radio" police "radio". Because their communications systems are going to be closed digital networks that are more like overair phone systems.

Work to make your local authorities understand the public benefits of open-broadcasting today. Let them work out the solution, but the important thing is to instill them with the value and urgency of doing so. The systems are going on line NOW and it's going to be harder when, as one local administrator here in Hillsborough put it, the concrete "dries".

70. Re: what is a attenuator

Newsgroup: rec.radio.scanner
Date: 1997-02-01 00:00:00 UTC
From: Bill Crocker <billc@rust.net>
Message-ID: <01bc0fdf$86894d00$8950c7cd@default>
Source record: 209397

Tom:

An attenuator decreases the strength of the signal from the antenna, into the receiver. Some scanners have built-in attenuators, usually a small slide switch, mounted on the back, that enables, or disables the attenuator. It is used when receiving a signal that is so close, or so strong, that it overloads the receiver and causes distortion. Attenuators can be purchased separately, usually in the form of a small in-line device that connects between your antenna, and your receiver.

"D.S. Fenstermacher" <scott@comp1.cc.wm.edu> wrote:

>Lately I have been hearing the local police respond with the term QSL. It
>appears that the response is just another way of answering in the
>affirmative. But what does it mean?

Hello Scott

QSL means "I acknowledge receipt of that message/signal"

A lot of hams seem to claim the INTERNATIONAL "Q" code as their own.
It is not their private domain. They use it in the same manner as many
professional radio operators do.

It is an Internationaly recognised code and is in use in most forms of
commercial and military communications through out the world.

Listen to the airband (civil or military) and you will hear all manner
of "Q" codes used in voice. Most commonly used will be the codes for
local baramatic pressure, tempearture, wind direction, speed, cloud
height etc...

The "Q" codes can be used in all modes of transmission from CW to
Voice and Data

Each 3 letter "Q" code represents a complete sentence. The meaning of
the sentence IS THE SAME, irrespective of the language (although
international air comms must use English! EG: A Japanese Pilot flying
a Nissan Aeroplane, landing in Tokyo Airport, talking to a Japanese
controller MUST converse in English!)

Running from QAA to QZZ, there are 676 possible variations of the
"Q". However not all Q codes have an *International* meaning allocated
to, some are deliberately left blank for future expansion AND for user
definition.

Each "Q" code can mean a question OR an answer (or a statement)
depending on the way it is used

For example: QSL? means DID you recieve the message, but just QSL
(with out the quetion mark) is the reciept. A person receiving will
never send QSL? so the circumstances are unambigious as to the
interpretation.

I have long since lost my copy of the international Q codes and cannot
remember them all. I would be most grateful if any one has them as a
file (or if you know of a URL) to email them to me

Here are some that I remember using when I was a professional morse operator back in the 1960s! (the exact wording may not be as in the manual but the exact meaning is the same)

QSA? What is my signal strength?
QRK? What is my readability?
QSB? Are my signals fading?
QRN? Is there static interference?
QRM? Is there radio interference?
QRL? Are you busy?
QRU? Do you have any messages for me?
QTH? What is your location?
QSY? What frequency shall I change to?
QAP? Are you listening on (frequency added)
QPR? Are you a Qeens Park Ranger supporter? (how the hell did that get there?) [English joke]
and the list goes on.....

A couple of UNOFFICIAL "Q" coced used by professional operators:-

QSS = This was a BIG insult to a novice or other morse operator whose "fist" was not readable. Meaning: Quit Sending Shit

QFO: when sent with QSS, the insult was magnified. It was "Quickly F**k Off. The literal interpretation was "Your morse is lousy, quit sending and put a competant operator on!"

BTW: there is also a 3 letter "Z" code in use in military comms that is also based on the same principles as the "Q" One that I remember is ZGN = "I cannot hear you"

There is an easy mod on the web to add a hold button to the RS unit.

> thank u

Hi Aslam!

Regarding Switzerland, I don't know. You can find out easily if
you call a well-stocked electronics dealer in Zï¿½rich. If they do
sell them, odds are they are just about legal :)))

It is probably not a good idea to use your scanner aboard an
airplane, at least not while in the air. Some airlines will not
even allow portable cd-players to be used while on board.

Why don't you try to picture the following situation :

You sit on an airplane just about to land (close to final approach),
you look out of your window,and you can see buildings and trees and
gardens passing under you in a flurry ,as you speed along ,getting
closer and closer to the ground.

Suddenly, your mobile phone rings! Who could it be? You pick up your
phone, and just as you press the "answer" button, you are violently
thrown towards your left,hitting the passenger next to you. The plane
has suddenly started banking heavily to the left! Now dropping its
left wing more than 45 degrees towards the ground! People start to
scream, and you feel a rush of panic flushing through your spine!

The rest is history..... All airliners have a ban on use of cellular
phones. They are known to cause sudden mailfunction on the advanced
onboard computer systems of modern airliners.

The episode I just referred to happened just a few weeks ago ,as a
Finnair McDonnell-Douglas MD80 was just about to land in Stockholm.
The autopilot suddenly de-activated as the two pilots were running
through their checklist before landing. What had probably happened,
was that a cellular phone activated the commands of the autopilot,
causing it to turn itself off.

Pretty scary stuff, huh?

Have a nice week-end!

Best Regards,
Knut Otterbeck

Of course others have answered your question allready, but I wanted to add a comment.
I was watching "Cops" a while back, and heard the Police usuing Q-codes. If I
remember right, it was Dade county, Florida, Sherriff's dept.
I thought it was interesting, as I thought they all used 10-codes.

Does anyone have experience with monitoring GE trunking systems.
PD here recently went 800mhz. Apparently 16 channels including control.
They've now added a tone that scans across all the available freqs.
periodically keeping scanner locked up and very irritating to listen to.

Will the BC235XLT effectively monitor this system?

Is there any off-the-shelf scanner software programs out there capable of
handling this situation.

Any thoughts??

Thanks

> Not everyone wants or needs digital. It will be quite a while before
> your scanner is useless.

Isn't this the entire reason that codes started to be used, such as
department specific 9-codes. The codes are the same as scanners, with
enough tinkering, you can pick up and completely understand what is going
on.

Rob

Nosy people can always overcome.

Andy,

The tones that were used for "station 51" were actually for fire station
50 in the City of Commerce (a contract city with the L.A.Co.F.D.).

The Quik Call 1 system has not been in use as a primary signalling system
for around 6 years. It still exists as a backup system but is rarely used

except for a daily test at 7am. (to wake up the troops)

I am a firefighter for L.A. County so I might be able to find out the tone frequencies for you, if so I will e-mail them to you.

Good luck,

Jeff

What you could be hearing is an "EXPORT" cordless phone imported to US
by
someone who came from South America where this band has been used for
such
devices. I have a friend who worked in Argentina where this was
discovered.
The other possibility is a person who is using a phone patch on ham
equipment
off the band... how far are you from Jersey City?

Source record: 209172
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi all,

I just picked up my second RatShack Pro-2026 mobile scanner, (display model for $129, and is cell modifiable too, yipee... :-))

I'm trying to tap into the Baseband audio output. So far I've been unsuccessful, it seems the noise level is higher than the signal level. When a signal comes across, the level of the signal is actually lower than when there is no signal. (I'm using wave editor to look at the signal).

The scanner have a 3359 chip and I'm tapping pin 10 via a 0.1uF cap, and the other wire is to ground. Is it correct ?

Any one else tried tapping a Pro-2026 ?

Any help will be much appreciated...

Source record: 209173

The 8500 makes a great paperweight, boat anchor, door stop, etc.

If you want to use it to listen to actual radio transmissions, forget it.
But a 9000XLT instead - many improvements.

If you don't believe me, ask yourself why Uniden took the 8500 off the
market only six months after introducing it and shortly folllowed up with
the 9000XLT.

I have a Bearcat BCT-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

111. Easily programmable scanner I/O

Newsgroup: rec.radio.scanner
Date: 1997-02-02 00:00:00 UTC
From: techno@actcom.co.il.NOSPAM
Message-ID: <E4zLGy.LHo@nonexistent.com>
Source record: 209178
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

Hi All,

Is there any scanner on the market that can output the frequency it is currently receiving (locked to while searching) and program another scanner? This is called REACTION TUNING by some, and is supported for example in the OPTO SCOUT, XPLORER, and others. The problem is that these devices are not so sensitive as well as might lock to unwanted frequencies. A scanner can be limited to a specific search range, thus rejecting all unwanted interference (in the Xplorer you could lock out up to 1000 frequencies, but in real time there is no time to start locking out garbage). Actually, I want to be able to monitor both the input as well as the output of repeater, and would thus like to be able to monitor TWO frequencies spaced for example 600KHz appart. If a scanner could output it's currently received frequency and a second scanner ready to receive a command to switch to some frequency, it would be possible to insert a PC in the way to translate the frequency and command the second scanner to the correct frequency.
The requested scanner can either be both input/output capable, or two different types of scanners optimized for each task. Any ideas, anyone?

Thank's in advance for any help.

When responding, please email directly in addition to posting here, since our news server isn't very up to date. Please note that you must edit the reply email address (remove the .NOSPAM postfix). This has been done in an attempt to reduce the amount of junk mail received here from automatic mailers. Thank you.

Sunday, February 02, 1997 - 15:51:55

I constructed a 12' foot wire antenna to hang out
my apartment window to capture the 30-50 band, and
use it also to scan the upper bands. My question is
,would I improve my reception to construct 3 other
shorter antennas for the VFH- high, UHF, and the
800 band.

A short answer would be appreciated.

Thanks

If Seattle is on a Motorola trunked system it will work as long as the system is NOT digitial which I don't believe it is.

116. WTD : Station 51 (Emergency) Tones

Newsgroup: rec.radio.scanner
Date: 1997-02-02 00:00:00 UTC
From: Andy Brinkley <brinkley@ols.net>
Message-ID: <32F50733.4F86@ols.net>
Source record: 209183
Cross-posted to: misc.emerg-services;,rec.radio.scanner

Hello All :

I am wanting to obtain the actual tone codes (or frequencies) for
Station 51
on Emergency.

The station tones used were the old Motorola 2+2 (Quik Call) system, and
would
have been a combination of 4 tones from reed groups A, B or Z.

I know someone will ask "What does he want this for"? ---

I own a two way radio repair shop and am in the process of designing and
building
a computer controlled station alerting sytem for a local fire
department. The alerting
system will have the ability activate Klaxons, turn on lights, un mute
the PA system,
etc, etc depending on the time of day and which company has been
dispatched.

I would like the demo unit to play the station 51 tones when the station
gets a call
just to show the capability of the alerting system.

Thanks

Andy Brinkley

I suggest that everyone has voyeuristic tendencies, and scanning allows
a person the indulge in that behaviour with complete anonymity. The
contents heard combined with that anonymity provide the vicarious
thrills. Given the range of intercepts available, the range of vicarious
thrills are equally diverse.

:Although laptop computers and other electronics are usually allowed on
:flights, they are only allowed when the announcement is made. This is
:usually only when in flight, and almost never during takeoff, or approach.
:
:More specifically, any radio device is rarely allowed in a passanger plane
:at any time. This is important because the body of the aircraft may act
:as an antenna or house the cables that route to sensitive equipment and
:aircraft antenna systems. While it is true that the same frquencies are
:existing outside the plane from broadcsast stations, cell phones and cell
:cites, and paging towers, the fact of the matter is that these radio broad-
:casts do not exist at the high field strengths within the aircraft that a
:local source of RF would create.
:
:Most FM radios, when tuned to the high side of the band have the internal
:local oscillator emitting radiation smack dab in the aircraft band, also
:scanners have local oscillators that emit radiation of varying frequencies
:all over the place.
:
:Why computers, nintendos, and other non-radio devices which still emit
:stray RF ARE allowed, I do not know.
:
Computers generate FAR MORE stray RF, at much more powerful levels than
a scanner ever would. A good example is- take your scanner and put it close
to the computer- the computer will desensitize the scanner very badly because of
all the crap it generates, unless you are using an antenna that is in a
different location. Any scanner I've used, was basically usless on VHF when
next to the computer, and on uhf, the squelch kept tripping open occaisionally.

Is it is a Motorola Trunked system you will be able to track what you
choose. In Broward County, Florida 12 different cities share a 25
channel system. As long as they are all on the SAME system, you
should be able to track.

ITEMS FOR SALE
Brian Webb, KD6NRP
Thousand Oaks, CA
E-mail 102670.1206@compuserve.com

If you decide to buy one of these items, you'll have to come by and pick it up (sorry, but my schedule is doesn't allow me to spend time/money shipping items).

1. RF cable. 30 ft length of RG-8 thick. Mil-Spec BNC male connectors on each end. Fabricated in SEP 1996. Cost: $15 or best offer.

2. 2-Meter FM/SSB Linear Amplifier with receive preamp. RF Concepts model 2-23. 2 W input, 30 W output. Purchased late 1993. Price: $55 or best offer.

3. 6-Meter Dipole Antenna cut for 50.125 MHz. Made of RG 59/U (Z-match section) and RG 8/U thick cable. Fabricated 1n JUN 1995. Price: $8 or best offer.

4. 60 Channel Scanner. Radio Shack model PRO 2024. Does not cover cellular telephone bands. Covers 29-54, 108-136, 144-174, 420-512 MHz. Purchased FEB 1992. Price: $50

5. Teletype/CW Reader. AEA model MBA-RO. Purchased OCT 1996. Works very well with reading Morse Code. Price: $25

6. Worcester AM Broadcast Band Active Antenna. Late 1960's vintage. Price: $ 15 or best offer.

7. Receiver Preamplifier. Ameco model PLF-2. 1.8-54 MHz. Purchased mid-1983. Price: $ 15 or best offer.

This brings to mind a question -

How will Uniden 'upgrade' the software in product after they
have sold it to the public?

I expect that our product's software will be "field upgrade-able"
as opposed to the Uniden product which will be permanent and
buried in the product for life - as in a 'mask programmed
microprocessor' like most of their scanner products.

130. Lincoln County, NC Fire Repeater (new)

Newsgroup: rec.radio.scanner
Date: 1997-02-02 00:00:00 UTC
From: jeffmulter@aol.com
Message-ID: <19970202211700.QAA15697@ladder01.news.aol.com>
Source record: 209197

Lincoln County, NC has activated a repeater on 159.165 MHz (107.2 PL) for fire dispatch and operations. The input to the repeater may be 150.995 MHz (107.2 PL).

All county fire units were asked to switch over to the new channel on Friday, January 31 during the afternoon. Some dispatching continues to be multicast on the original dispatch channel, 154.265 (107.2 PL).

I had previously noted radio technicians working on the repeater about 2 months ago. According to their conversations, the new channel may comprise one repeater, with an eastern (Boger City) and a western receive site.

Although I am not a regular listener to Lincoln County's communications, they may have also undergone some other changes with the implementation of this repeater. During monitoring today, I have noted that they are now using station numbers, rather than names, for dispatching.

Area hobbyists who will monitor this frequency may also note Virginia State Police on the frequency during tropo conditions. VASP - Wytheville, using a 167.9 PL, is somewhat common during tropo conditions. VASP - Chesapeake (146.2 PL) has also been noted on a couple of occasions at my location.

Lincoln County is also multicasting its EMS traffic on both 155.160 (107.2) and 154.815 (107.2). This has been taking place for about 1 and 1/2 years, although I have yet to note any listings for 154.815 for Lincoln County in the frequency databases. Please feel free to e-mail me if you can offer any infor-mation on how the 154.815 channel is or will be used.

> >

Part of the dealer's response may be that Opto seems to be taking everything direct and not selling through dealers. Now there is no competition between resellers. This may be good for Opto since they can now realize a larger margin but perhaps limit their exposure. If their products are strong enough and they continue to be prolific advertisers, they may be able to keep their volume up and prices down somewhat. It appears to me they are taking their technology to the bank as much as possible. I would like to see them with a little competition.

About two years ago when the Scout came out that supported the "reaction tune" firmware,
I bought two of them. One for an AR8000 and one for a 2006/OS456. I bought them through EEB who had the lowest prices anywhere (during Dayton). I am now considering buying an Xplorer. So I started asking around to various dealers. That's when I found out that you have to deal with Opto directly.

Not to take away from their products. They are unique in the industry and seem to be designed and built well. I am in no position to judge if they have a true corner in the market or if another manufacturer has similar technology in the works. Their ability to scan from DC to 2 Gigs or so as quickly as they do seems to be unique. I just think that a little competition would be good for the market and would force companies to provide as many features as possible at the lowest price. (I say that somewhat selfishly, being on the purchasing side of the transaction.)

I'll probably still buy an Xplorer. I just have to decide if I wait until Dayton in hopes they'll be on special or not. I would seriously consider becoming a reseller if the dealerships were available.

> QSL via bureau UBA Belgium Hi Bill; you didn't say on what op system or PC you are
running this,
but there are several possibilites;

a. For most Windows users, you MUST run the ACARS software in a DOS mode. This does not mean a DOS box (as you can in Win95) but completly outside Windows. The reason for this is that ACARS and Windows conflict because each wants to control the serial port connection exclusivly. So you must exit Windows (yes, even '95) completly to run ACARS.
b. Leave your squelch completly open. The reason for this is because most squelches don't react fast enough, and part of the message will be lost before the audio reaches the interface.
If you are interested in getting more info on ACARS, come join us on majordomo@grove.net . Send a message like the following with nothing else in the body of the message;

subscribe acars
We also have a digest service (acars-digest) if you are interested in that. To my knowledge there has been no shareware development of ACARS software, but who knows that may change one day...73s Mike (colistowner, ACARS)

134. bc200xlt cell phone mod

Newsgroup: rec.radio.scanner
Date: 1997-02-02 00:00:00 UTC
From: theebaker@aol.com
Message-ID: <19970202221200.RAA18629@ladder01.news.aol.com>
Source record: 209201

I have read that I could cut the resisor on my scanner (bc200xlt) to allow the cell phone frequencies to be heard. I have taken my scanner apart and identified the resistor, but I am not sure if this mod will work or if it will affect any other operation of the unit. Does anyone know if this in fact will work, or better yet, has anyone actually performed this mod? I am just a little apprehensive because I would hate to screw something up.

Thanks alot for all the help you people have given me as I am fairly new to scanning.

> request a catalog.I used a cellular phone bracket sold by AT&T, and used velcro on the
Pro-43 and bracket to keep it secure. Works great. It's a flexible
shaft about 8 inches long, and can be tightened or left flexible. It
screwed into the floor using long sheet metal screws. Cost was about
$20. You'll need to remove the belt snap on the back of the Pro-43.

Hello,

My name is Sebastian and I am French.

I bought 2 weeks ago a Yupiteru MVT-7100.

I was very excited to use it but unfortunately, I had a bad surprise... The instruction book given with the product was written in japan !!! The french dealer doesn't have any more french version...

Could it be possible to have something written in french or even in english in order to make my MVT 7100 works ...?

You can also use my e-mail (if you have a .doc or .zip of the instruction book.

engasser.seb@infonie.fr

Thank you very much for your 'international' help... :-))

See you on line.

>--

What is a 'private airliner'?
Most high powered ham communications I have encountered from aircraft are using the aircraft radio installation, just tuned to a ham band. Aviation equipment is highly unlikely to cause a problem, it is designed to work with other avionics.
If you doubt that your toy can cause a problem set your scanner beside it and scan through the aviation bands, especially 108 - 138 (yes it is 138) MHz, 225 - 400 MHz (there are non-military navigation systems on this band) and 962 - 1215 MHz. If you hear any noise from your toy it is a potential threat to the communications and navigation systems of the aircraft. During the final stages of a landing approach it may be a fatal threat.
In addition to the radio communications systems there are numerous on board electronic systems which may suffer from RFI created by your toy. I agree that better engineering could probably avoid the problem, but it exists and bitching ain't gonna cure it unless you can convince the FAA to legally require complete RFI immunity, and are prepared to pay the cost in taxes and increased air fares.

Dave

Source record: 209210

Hi Bill, Here's some old notes on the 166.325 request, you'll have to monitor it to see what info still applies.

166.325/166.925 is the rptr configuration from my 1992 notes. I believe this still applies as I've encountered the input last yr while searching the 166 band. I have a listing of ch 1, possibly as rptr but that needs confirmation as I recall hearing an officer say "switch to one" and the conversation disappeared (simplex?).

You might want to monitor 417.250 for the UHF link to these two freq's. Old notes show 417.825 as used by NY units, possibly the link freq.

Most likely you're hearing Sandy Hook also. Monitor 167.075 and 168.550 for comm. You can hear the 168.550 in N Jersey but I don't know who the user was. Sandy Hook's maintenance dept will be the user you hear. I usually hear 900, 300, 500 series units IDing. I think KFC-732 may be one of the stations on the 168.550 freq.

166.775 is another Sandy Hook freq to monitor. You should be able to hear all of the freq's I post here from you locale in CJ.

I can't find the info in my files but one of the above, 166.775 or 168.550 was used as during a surveillance (drugs) one night. Nothing good but they were observing individuals, FYI.

One freq I never followed up on was 169.400 used by Sandy Hook. It's rptr'd. caught it first in '93, plates were being run by a 500 series unit.

They once checked on fishermen at Horseshoe Cove, which is on the bay side of Sandy Hook. You may hear them late in the evening kicking people off the beach after sunset.

Base ID's as 570. You'll hear "Sandy Hook Emergency Services" on this channel also. Alerting tones are transmitted here.

It seems the Park is wired by CSC Alarm Co. (whoever they are) and officers responded to the report of a building alarm one day but no details were given.

I rarely travel down there anymore, so I can't be of too much help. The Rangers patrol the parking lots all day so you should hear plenty of activity during the Summer months. Load all the freq's in plus whatever else you have and see what's active.

I've used a freq counter to capture the 167.075 down there. I don't know where the transmitting antenna is. They do have DVP and they use simplex at times but even in the CJ area you should hear some of the simplex if your close to the coast line.

Many of the US Parks freq's are used Nationwide. Some of the above are confirmed for Philly, Maryland and you should be able to hear comm from The Delaware Water Gap area too (166.950)

Hope this info is helpful, sorry I can't add more but if you do monitor anything, please let me know what you find, I can finally update my notes.

Regards,
LGS

It seems it's more acceptable to break the law for personal gain than to break the law in order to expose another's wrongdoing. Remember the jury who awarded some outrageous sum to a supermarket, when ABC cought them selling outdated meat. ABC employees had lied on employment applications to get into the stores (and took hidden cameras with them). I guess the jury didn't take into account how many cases of food poisoning the ABCs expose prevented.

There's all sorts of high-powered RF floating around. Not all of it
is predictable.

>>>Pretty scary stuff, huh?
>>
>>What's scary is thinking about airliner systems so poorly designed
>>that random RF could cause a major malfunction.
>So why risk it? Surely you can do without your radio equipment for a
>while, especially trivial stuff like scanners.

I have no problem with it. My problem is if the plane's systems are
so poorly designed that a cellphone or scanner can bring them down,
they're not safe. The fact is, they *are* generally safe, and the
airlines prohibit SOME sorts of RF for liability reasons.

I've talked to people flying on private airliners who were using
high-powered ham gear with no problem. And airliners generally allow
laptop computers, some of which emit a hell of a lot of stray RF.

Bill,

From what I see on my listing, that might be the U.S. Park Police. Not
sure tho, double check.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[...]

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there
is no audio and the green backlight no longer functions, a
tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201
(2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC
to several stages of the BC200XLT. Its main purpose is to
switch off power hungry stages of the BC200XLT when the CPU
thinks the NiCd voltage has fallen below a threshhold.
That's an attempt to limit the current drain on weak NiCds
to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the
Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current
through it. In one case, capacitor C36 shorted. It's a 220
uF 10v electrolytic, located on the component side of the
main board, connected from pin 8 of the audio IC (IC2
NJM386SL) to ground. Capacitor C55 shorted in another
BC200XLT. In a pinch you bypass Q201 by soldering a short
piece of bare wire between the collector and emitter, but
you must first fix the component which caused Q201 to fail.

I purchased an Optolinx directly from them about 1 week ago without any
problems. They were very nice on the phone when I called and said they could
ship immediately via COD...which they did. I received the unit 2 days later
via ups blue. Works fine.

Source record: 209256

"Sean Wagle" <not.my@real.addr> complained:
> Sheesh. How many days a week does this get asked?

Unfortunately, newcomers to the hobby are not born with an innate knowledge of the field, or even an imprinted list of the resources available. In calendar 1996, the cellular phone frequencies were requested ten times, at roughly monthly intervals.
The record holder remains cordless queries, with 26 questions that were answered with a posting from the FAF. The interval between requests was commonly about 10 days, which is probably the retention period at most ISPs. GMRS & FRS produced 7 posts; Air & Mobile phones 5; C.B., Marine VHF and Film crews/Wireless mikes had 4 each. Dot frequencies, a top topic in prior years, only generated 3 requests.

While regular readers of r.r.s may find the requests for cordless and cell (and other Frequently Asked) frequencies repetitious, the yearly volume is probably less then the (mis)information and opinions generated by Newt's cell conversation alone. The purpose of a newsgroup is to exchange information, and maybe lead a newbie to some of the resources available.
In other words, cut the guy some slack!
/* barry /&

(For those who may wonder about the references to the FAF, it is the Frequently Asked Frequencies file, available at:
ftp://oak.oakland.edu as /pub/hamradio/docs/misc/scanner.faf
CompuServe - Hamnet as FAF.TXT
and contains
Details of the most often requested bands. Includes channels, frequencies and usage notes for: cellular, cordless, mobile & aero phones; TV; CB, FRS & GMRS; railroads; marine; aero; public safety intersystem; ambulances; weather; et al.)

I read someplace that there's a transistor that goes bad, and causes
that. I don't remember where. Try searching for 200XLT or 200 or XLT, and
it might point you to the right web page.

every one is debating about "listening" to the digital phones...yes it will be able to be done and is being done. there are ways to convert phones them selves into the scanning tool. Look at the oki CTEK cables that made the oki 900 into a powerful scanner with handoff folowoign capabilities. the same will happen with digital

Sins a long time i'm looking for a working sollution to receive and
decode the ACARS.

I have 2 different schematics and 2 different software packages. The
software is from AEA and the other from LOWE.

Some people says that the AEA software is working fine with a hamcom,
when i start the program, i see the data-indicator going on and off buth
the screen stay's empty. (ill try'd with squelch and volume settings
buth nothing works)

The LOWE needs a hardware key.

I'm thinking of bying a complete system with software and interface buth
is it going to work with my TH-79 from Kenwood (should i look for the
problem in the receiving of my Kenwood ?)
Still the litle interface from LOWE is to expencive.

MY QUESTION IS :

Are there any people out there who are working with homebrew interfaces
and what kind of software do they use with it ?
Are they welling to share the schematics and software ?
Sins there are not much people who are intrested in the ACARS system i
don't think to get lots of mail.

A SECOND HAND INTERFACE WITH SOFTWARE IS ALSO WELCOME !!

Thanks to all and ill hope my loking is going to end now :-))

William

Actually, yes, you can purchase scanners in Canada with U.S. cell frequencies in tact. I don't know if it's common, or not, but in the Niagara Falls area I have seen several stores carrying scanners with U.S. cell enabled. I don't know when they were manufactured, though. Still, they are available.

> thanks, ...Abe

The Radio Shack FRS-105 uses channels 1 - 7 only. I think it's
the same radio as the Motorola Sport 7x.

The Midland Model 75-510 is the only 14 Channel FRS radio that
I am aware of. It can be purchased through EEB for $149. The
unit has 14 Channels with a Scan function that allows you to
Scan all 14 FRS channels. It can also operate with 38 different
CTCSS Tone (PL Tones). This model also comes with 4 AA Nicads
and a 6 volt Charger/Adapter.

If anyone is considering purching a FRS radio, then I recommend
the Midland Model 75-510!

The other models of FRS the available are:

The Motorola Sport 7 lists for $119 at EEB
The Motorola Sport 7 lists for $99 at Southern C & E

This unit does not have an external channel knob. You must
flip some dip switches inside to change channels.

Batteries are not included

The Motorola Sport 7X lists for $139 at EEB
The Motorola Sport 7X lists for $129 at Southern C & E

This unit has an external channel knob to change channels.

Batteries are not included

The Radio Shack FRS-105 lists for $179 at Radio Shack

This is Motorola Sport 7X under the Radio Shack name!

Not sure why it costs $40 more a Radio Shack!

I had posted the original "Trunk Tracker Snafu". While response has
been great nothing but conflicting information has be received. On
02/02/97 JVpoll@dallas net (Jim) States "Our product has no
limitations"..(on trunking frequency input). It is signed under the
title product development specialist.
It certainly not clear at this time what the correct response is to the
question. Can we really determine the correct answer, or is it going to
remain elusive ?

Ok This may clear things up
I think jim is referring to another product in development that will
also follow trunk systems He is the developer if I recall

however to use this you need $400.00 for the interface, software, ect
a computer and I think a pro-2006 and that family

It covers more than the trunk tracker but it's a hell of a lot more
expensive and it only works on certain radios after the mod

most of my information is probably incorrect /prices and the lot but
you get the general idea

$400.00+ for abc system not handheld
$250.00 for xyz system is a handheld with more units coming
hmmm I wonder what one I would use.

I mean no malice but it seems like an advertiser is trying to confuse
the thread with an advertisement.

Again I am in no way flaming his product
I am just commenting on the confusion his post seemed to have caused

The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994 by Bob Parnass, AJ9S

[....]

The knob can be operated as a channel selector or as
a VFO control. We discovered a technique, not mentioned in
the owner's manual, which let's one enter a frequency and
tune around without actually storing the frequency. To
tune around 154.6 MHz, for example,

1) press MANUAL (if not already in the manual mode)
2) press 154.6
3) press TUNE
4) rotate the knob in either direction to begin tuning

Yes, the BC8500xlt is far from the "PERFECT" scanner, but its not
useless. I have used one for over 2 years , running 24hrs a day
recording Military Aircraft. The reception in the MILAIR band is good
and the 100ch per sec. scan rate allows me to monitor 300 freqs with few
misses. Also the Squelch Controled Tape Recorder function works quite
well. In the $350 price range the BC9000XLT is by far the best buy, but
I would buy a used BC8500XLT if it was around $200.
My 2 cents, Steve in Escondido, CA

Well, sounds like "dual-conversion" troubles (or happiness..) to me. I'll use a Radio Shack Pro-51 as an example:

2 x 10.7 = 21.4
(where the "2" is used to double the first IF frequency "10.7", and "21.4" is the result.)
(IF frequencies can be found in your scanner manual [usually] in the specs. section.)

So to receive on a band you don't normally get, take the final number (in this case "21.4"), and add or subtract it from a frequency you can get, so that the number is in a band you don't get. Example:

156.800 - 21.4 = 135.400

(where 156.800 is the freq. you CAN get normally, minus the 21.4, equals 135.400.)
So, with my Pro-51, I can listen to 156.800 and REALLY be listening to 135.400. I'll also hear whomever is using 156.800 normally, of course. Also, you must be able to receive in the mode of the band you want to listen to. In this case, you'd need to punch in AM while on 156.800.

This little "trick" applies to dual conversion scanners only, triple conversion scanners and higher won't do it.

Have fun applying this to any band you can think of!

While it may be next to impossible for someone to get caught
listening to cell or cordless phone calls, it isn't impossible.
However, the main thrust of the law was to add a degree of
punishment for those who listen and then tell what they heard.

Yes, I used the attenuator in NFM mode. Turns out there is strong signal at
154.845, so when I tuned down from 154.83 to 154.8275, things worked fine.
However, if I turn the attenuator off, I don't hear anything.

216. ATTN: Shinwa SR001 Owners?

Newsgroup: rec.radio.scanner
Date: 1997-02-03 00:00:00 UTC
From: Greg May <greg_may@cv.hp.com>
Message-ID: <32F62B38.3BFF@cv.hp.com>
Source record: 209040

I would like to connect with any Shinwa SR001 Commmunications receiver owners to find out more about the units including getting technical manuals (repair manual is out of print).

I will be digging into mine to replace some keyboard back light parts as well as the lithium battery backup. All else seems fine.

Also looking for anyone who has comparison experience on how this unit stacks up to other equipment.

I have a manual if anyone needs a copy.

Thanks, looking forward to hearing from you.

I'll be picking up my fiancee at the airport next weekend, and I'd like to take a handheld scanner with me. I was wondering if airport personnel frowns upon scanner usage. Will I have any trouble getting through the metal detector while carrying my scanner? I mean, will it freak out the security guys? If it makes any difference, I'll be at MCO--the Orlando International Airport.

Also, where can I find a list of frequencies used by the different airlines? I'm especially interested in freqs used by Delta Express. Will I be able to pick up communications clearly while in the terminal?

Getting caught is a small likelyhood, unless you make it widely known
what you are doing (like the couple in FL.)

It might. I usually lock it in my briefcase and just have the x-ray the thing - fewer questions asked. Of course, it hasn't ONCE stopped them from opening the case and looking at all the neat things in there, though what they'd find fascinating about a radio, two floppy disks, a CDR, a stethescope, several pads of paper and a yo-yo escapes me. Regardless, they just smile and say, "Thank you, sir." This in Canada, where you need a bording pass to get beyond the sterile corridor. I have no idea how things work in the US these days. (I'm interested in knowing; I have to go to Tucson later this month.)

Your best bet might be to just drop it in a backpack or something. *OR*, you could call the security manager at the airport and just ask them for a more definitve answer. :)

: Also, where can I find a list of frequencies used by the different
: airlines? I'm especially interested in freqs used by Delta Express.
: Will I be able to pick up communications clearly while in the terminal?

Given that you'll probably be line of sight to the tower or the antenna complex for the ground stations, as well as be able to see the flights landing, you'll probably do okay. You'll do better there than anywhere else, actually; probably be able to grab the low-power signals from the hand-helds on the ramp and whatnot.

Put it this way, I used to be able to pick up most of the air-to-air/air-to-ground comms from the airport on the other side of town (twenty minutes away at 100kph) from my place. You should do fine.

I have been monitoring the FMRS frequencies in the Huntsville AL area.
I hear activity on 462.6 in the evenings. It sounds like it maybe
commercial or individuals discussing pick up and delivery. It sounds
like a repeater output. I have all 14 FMRS frequencies programmed
including the 467.6 which should be the input if this is indeed a
repeater. Even with an outside antenna I can't hear the input. Since
this is a FMRS frequency why can't I figure out the PL frequency and use
this repeater myself??? Does anyone know who's repeater this is????

It shouldn't matter to them a bit. It's not a weapon, it's not an explosive and it's not a threat to anyones safety. Let them scan it as if it's like any other piece of luggage/carry-on and you'll be fine. I take my scanner into Atlanta Hartsfield International all the time and it's one of tightest airports around (since the Olympics).

I would try Delta's normal freqs first. I don't think DE changed anything but the paint job on some of those planes. I have a massive list of Delta stuff for Atlanta but nothing listed for Orlando. Yes, you'll be able to hear as clear as a bell in the terminal, unless it's noisy as hell.

You are dead wrong about this. You may not WANT it to be illegal, and it may be a dumb law, but YOU ARE violating Federal law whenever you tune into a cellular or cordless conversation within the borders of the USA. Just because you haven't been caught at it or prosecuted for it does not make the law go away. Advising people that the law does not exist is stupid and irresponsible.

This is a poor argument for two reasons (at least):

1. Military trunked systems use different specifications and
algorithms than commercial and public safety systems.

2. Uncle Sam is still trying to control the encryption industry. I
don't think the military has any inkling that anyone could descramble
their comms, so their solution would be to scramble whatever they
don't want monitored. And they certainly have the money...

Hiya!,

I know DCS stands for "Digital Coded Squelch." And I know DPL stands for "Digital Private Line." I've been eyeing the Relm 200 scanner which has a DPL/DCS capability.
Are there any other scanners out there with a DCS/DPL capability. I already have a BC9000xlt w/CTCSS (great for the non-digital PL's), but I'm curious if there are any other scanners out there with DCS/DPL & CTCSS as well. Any info about Relm 200 helpful too! Please email me info.
Thanks!!

After using a Scout and a AR8000 in my car for a trip to Georgia a bunch of questions pop into my mind.

1) Had anyone seen a FAQ on the best way to use the Scout? The instruction manual is not the best for real world usage.

2) Why does it only seem to use NFM? It seems like 90%+ of Scout hits cause no signal to be received by the AR8000 even though it is reaction tuning. It hit's on CB's all the time but they are AM and not NFM.

3) Can REMOTE be reestablished without resetting the Scout if you take the AR8000 out of REMOTE?

I guess it's worth the $350 since it did tune in Burger King's drive thru while we were there!

Probably. Typically, all units involved in a localized tactical incident will go simplex, including the airship. If the incident is likely to be short in duration, they'll usually just use the output of the dispatch frequency - if it's likely to be a longer incident, or one that might require the use of a repeater, they'll ask for a tac

Let me draw a comparison here between this law and another one.

When contact lenses become commonly available in North Carolina, opticians (who are licensed to measure eyes) wanted a peice of the action. However, the opthamologists (who are licensed to treat diseases of the eye) argued that only *they* should prescribe contact lenses... since lenses after all *are* foriegn objects in the eye which could cause an infection.

The legislature listened to both sides, and passed a law that opticians could sell lenses only if a person visited an othpthamologist and got a prescription saying he was "OK for contact lenses."

So anyway, I went to an optician and got lenses without an opthamologist's prescription. The optician said that it wasn't *really* a law in a certain legal sense until someone was prosecuted, and the basis of the law was upheld in court.

This happens all the time. Plenty of laws are passed, only to be struck down because they are unconstitutional, discriminatory, conflict with existing law, are unenforceable, etc.

My point: Yes, listening to cellular phone calls is against an *existing* law. But until someone is tried and the law *passes muster with the courts*, it's in limbo.

Still, I would not like to be the test case.....

From: dragon@netshop.net
Message-ID: <5d5p9q$8mj$1@noc.van.hookup.net>
Source record: 209062

I have a question about scanner antennas. I have built a antenna to pick up freq. from 30MHZ to 500MHZ and I have also built a discone antenna to pickup 700MHZ and above frequencies. My question is;

-should I put a y-connector on my roof to connect both of them or should I run two seperate 50 ohm coax cables directly to my scanner and have the y-connector connected directly to my scanner? The reason why I ask this question is that I was wondering if I would get crossover interference if the y-connector was joined to early in the antenna signal detection phase. This probably sounds like a stupid question, but I thought I should ask it anyways before I proceed with this project.

Any help or suggestions would be greatly appreciated.

>used at the same time on the same recorder for the functions to work as
>designed....

Maybe your scanner is defective or you have the Volume control
set too low. The Volume control affects the audio level to
both the Recorder and External Speaker jacks, since they are
connected to each other through resistors.

My BC9000XLTs furnish an audio signal at the front mounted Recorder
jack at all times as long as the Volume control is set loud enough.
I feed the audio to the input of a baby monitor repeater.

This is independent of the tape control relay inside the BC9000XLT.

I have an Optoelectronics Scout which works fairly well except for powerful FM broadcast stations. These dominate the Scout, at least in the rural areas, for miles around. One FM station in my area even sets off the scout INSIDE a shopping mall, 3 - 4 miles from the tower!.

I understand that the N100 ($99) is supposed to offer a 35 dB notchfor FM. Has anyone use this and can offer comments? Seeing as the cost is 25% of the cost of the Scout, I'd like to know it is worth it. Thanks.

Fred K, N9SLR

If the logic is present for 800 MHZ, one would think it would trunk above and below 800 MHZ. The software must limit keypad entry, seems like a waste. Sheesh !
Now onto a new question, for those with the demo unit. The review (grove.com) indicates radio is limited to a total of 500 maximum Id's for 10 systems or 50 individual ID's per system (a bank = 50 users). I hope that you can duplicate systems on other zones or banks as 50 users per system is simply not enough.
For example: NJ ST PD has more than 50 Type II ID's per system. One would need to duplicate same system in other banks in order to catch all the users.

Hope the logic can deal with this. Any ideas ? Thanks !

PS Lets hope software gets a mod before release to allow above and below 800 MHZ trunking !

The City of Seattle apparently sees the benefit of broadcasting. Word has (although I'm not clear on the specifics) that the city has authorized amoethod where the public may subscribe to a radio (I think you buy it) that is programmed to public safety dispatch channels. The atricle I read made specific mention that "TAC" channels were not included.

I just bought a pair of the SPORT 7X models (the 7X has the external channel selector knob, though it costs $25 more than the model 7 without it) from BassPro for $124.95 each. They seem to be very nice little radios, and supposedly quite rugged (I haven't bashed mine around to prove it though).

With batteries (3 AA), they weigh-in at 7 oz! Quite nice, since I plan to strap them to an arm-band arrangement for skiing (keeps the antenna up in the clear and doesn't impede motion).

They have a half-watt output under FRS rules.

Cabela's has the model 7 only, for $99. (1-800-237-4444)
BassPro has the 7X only... $124.95 I think. Don't have their number offhand.

They come in black and camo, with the black appearing to sell out very quickly. The camo is nice though. They also take accessories, such as speaker/mic, headset, etc.

I'm glad I got mine, though I'm anxious to see other models as they get to market. I hear that UNIDEN and ALINCO (DJ-S46, I believe) will be releasing some soon.

The Motorola's handle the PL-tones, as most do (in case there's any confusion on that point!)

>switching ICs to isolate the wires and switches from the CPU.

Well, remotely controlling a scanner via keyboard keypress emulation
is relatively easy (since it's easy to tap to the keyboard contacts).
Anybody have an idea how to monitor the received frequency (very
useful for frequency activity logging)? The problem is that it's not
practical to "eavesdrop" on the CPU to LCD writes, since this is an
LCD specific protocol, with many commands in addition to the actual
frequency data. Is there any scanner (preferably low-cost...:-) that
can output it's currently received frequency to an interface
(preferably RS232...)? Better yet, a scanner that can acept commands
as well as output info to PC via a data port? I'm sure there are
high-end units available that can do this, but how about moderate cost
units?

When responding, please email directly in addition to posting
here, since our news server isn't very up to date. Please note
that you must edit the reply email address (remove the .NOSPAM
postfix). This has been done in an attempt to reduce the amount
of junk mail received here from automatic mailers. Thank you.

: If the logic is present for 800 MHZ, one would think it would trunk
: above and below 800 MHZ. The software must limit keypad entry, seems
: like a waste. Sheesh !

Since the majority of the police/fire trunked systems out there are on 800 MHz (and that's what most people want to monitor), it seems to make sense to make the scanner cover 800 MHz first. As to the 400/500/900 MHz systems, it is my understanding that the unit will not cover them because the channel assignment codes are different. Covering all of them in one radio is going to be a rather time-consuming development effort, just as covering both GE and Moto in one radio is going to be rather complex. Getting a functioning TrunkTracker on the market will provide valuable input as to desired user features and functions when the R&D teams go to make the ultimate trunking scanner that will do all the toots and whistles.

: Now onto a new question, for those with the demo unit. The review
: (grove.com) indicates radio is limited to a total of 500 maximum Id's
: for 10 systems or 50 individual ID's per system (a bank = 50 users).
: I hope that you can duplicate systems on other zones or banks as 50
: users per system is simply not enough.

Correct. You can program in 10 different systems, or the same system 10 times, each with a different talkgroup layout. This is what I did with the demo model I reviewed for National Scanning. It worked very well indeed.

: For example: NJ ST PD has more than 50 Type II ID's per system. One
: would need to duplicate same system in other banks in order to catch all
: the users.

So does the local big system here; however, all I needed to do was program in the most important stuff. The vast majority of the 300+ talkgroups on the local system are rarely used, and I found 50 to be sufficient for monitoring the most important activity. More would be nice (100, for example), but 50 is OK for now.

Let's not get too nit-picky right off the bat, everybody. At least there is a functioning product coming out. The bells and whistles, as well as the major improvements, will come along in due time.

As a commercial pilot I will post the following from Transport Canada
Air Regs.
Some portable electronic devices can interfere with aircraft
Communications and radio navigation systems. The radiation produced by
FM radio receivers and television broadcast receivers falls within the
ILS localizer and VOR frequency band, while the radiation produced by

the AM radio receivers falls withnthe frequencey range of the ADF receivers. This radiation could interfere with the correct operation of ILS,VOR and ADF equipment. Pilots are cautioned against premitting the operation of any portable device on board during Takeoff , Approach, and Landing.
It also goes on to talk about calculators not being allowed as well. Lets put it to you this way if you on an Airplane that is landing in fog or low cloud and the pilot is using these instruments would you like him to land in one piece. The ILS is used on final approach to tell the crew where the runway is and if the aircraft is lined up with the runway.If there is interference with these instruments the pilot could be lined up with the wrong rumway or no runway at all. Lots of Airports around the world have parallel runways and conduct side by side landings.
It is up to the Flight Crew as to when you can use this equipment during other parts of the flight. I say take it then ask when the aircraft has reached level flight and there should not be a problem.The above regulation is pretty standard around the world.
I hope this answers your question.

Phil

267. 2006 and scout question....

Newsgroup: rec.radio.scanner

Would like to hear from anyone who uses a scout/opto/2006 system.

Would like to know what you think of the combo,
and any special mods,hardware you might have configured.

Will be sharing my scout with my 8k and 2006/opto and would
like any headsup on pitfalls I might encounter......

Thanks !

Richard Reider

Here's some to try:

461.6125, 466.2625, 466.9625. Those are the frequencies used out here in
Arizona
at the Tucson and Phoenix area stores.

>

Since the Uniden scanner has no transmitter, it won't be able to affiliate with the site. In the typical Smartzone system, transmitters are only keyed up and audio is only sent to sites where radios are affiliated.

In general, you will only be able to hear audio at a site if a 2-way trunked radio is already affilated at the site and is also listening to the talkgroup you want to hear.

C>info. Thanks!!

DCS and DPL are the same thing PL and DPL are Motorola trade marks,
CTCSS and DCS are the generic terms for them. AFAIK, the RELM HS 200 and
the forthcoming mobile version are the only radios with DPL/DCS
capability. I always thought that the BC-9000XLT had DPL capability.

I've been telling myself not to get involved in this thread, but I just can't hold myself back any longer.

I bought a cellular phone about 17 months ago. When I purchased the phone, I also purchased an extended-life battery which is supposed to have 36 hours of standby time. In the beginning, I did get 36 hours of standby time out of the battery. I ALWAYS used the battery until the cellular phone indicated that it was discharged. I then placed the battery on the trickle charger that came with the phone until it was fully charged (12-18 hours). After 10 months of this, the battery was only giving me 24 hours of standby time.

In July of last year, I purchased a charger/conditioner. Since then, I have used the condition cycle each time I recharge my extended-life battery. Guess what? It now gives me 36 hours of standby time. It didn't happen over night, but it has been a steady improvement.

Around the same time, I also purchased a charger/conditioner for my camcorder batteries. I had a battery that had been used on the camcorder until the camcorder said it was discharged and then recharged. It was only giving me 20-30 minutes instead of an hour. After a couple of conditioning cycles on the charger, it was back up to an hour.

In both of these cases, the NiCd batteries were being discharged until the electronics device was no longer able to use them, however they we're not completely discharged. NiCd batteries work best in application where you completely discharge the battery before recharging it. By "completely discharged" you discharge the battery to around 0.9 volts per cell.

WARNING: PERSONAL OPINION

If anyone tells me that NiCd battery conditioners are a waste of money, I'll tell him he doesn't know what he's talking about. I've seen it with my own eyes and am very pleased with the results.

END WARNING: PERSONAL OPINION

>>Lately I have been hearing the local police respond with the term QSL. It
>>appears that the response is just another way of answering in the
>>affirmative. But what does it mean?

QSL Means "I am acknoledging receipt of your message". On voice,
the traditional term for this is "Roger", or in CW, R (.-.) three
times. Q codes were intended for CW, but a few painful ones like
QSL slip in way too much. One would assume in routine two-way
contact that if someone did not understand something, they would ask
for a repeat.

>QSLs are used to backup logs during contests and such. Some are also pretty nifty
>looking, aswell (atleast the ones I have seen).

A lot of people do quite a bit of collecting them.

>
>By the way, does anyone know if QSLs are ever exchanged on 6 meters? 2? 440?

I return a card for a contact on any band or mode whenever I am
asked. I also like to get them for every HF contact.

: Although laptop computers and other electronics are usually allowed on
: flights, they are only allowed when the announcement is made. This is
: usually only when in flight, and almost never during takeoff, or approach.

I have no idea what the policies are for international fligh‌s, but
Canadian Airlines has changed its pre-flight announcement to say that you
may use your cellular telephone while the aircraft is on the ground, at
the gate, but once the engines start, forget it - switch 'em off.

Similarily, all RF-emitting devices must be disabled while "sterile
cockpit" operations are in effect - essentially, during take-off, landing,
and final approach. (A good rule of thumb is if they won't let you put it
on your tray table, don't bother. You can also go by the seat belt
indicator - if it's on, turn it off.)

The same thing applies to working in hospitals - all communications gear
must be in the receive-only mode, and cell phones have to be turned *off*.
(The problem is that people don't realize that even when they're not using
their phone, it's still transmitting and interrogating the cell sites.)
But I've never had problems carrying either a two-way or a scanner into a
hospital, let alone a laptop - an environment that is, I think, far more
susceptible to stray RF than an airplane.

Considerations beyond voice privacy are driving public safety agencies to digital
systems. They are just getting a head start on private users in advance of the
spectrum re-farming initiatives of the FCC which are going to require narrower
bandwidths. In many instances, analog systems cannot be narrowed or tightened
and still transmit intelligible information. Digital systems (such as Motorola As-
tro) use spectrum much more efficiently and can fit a message into a narrower
modulation envelope. I wouldn't be surprised to see some other private licensees
go digital as well-however, even if most police traffic is lost to casual monitoring,
there will still be analog systems in the other services to monitor-but with nearer
adjacent channel users and posssibly reduced power.

The Bearcat 3000 is probably the better scanner. The only real advantage the Pro-26 has is it can be run on alkaline cells or ni-cads. The 3000 has a slide off rechargable battery pack, so buy an extra to have on hand when the other one goes dead right in the middle of that gnarly police chase.

The Bearcat has more channels, better intermod and image rejection, and has better audio thanks to a bigger speaker. The Pro-26 has a bigger display. Buy the 3000 and you won't have any regrets in my opinon.

Mike, for one thing, yes security is a problem. Ask the officers you know if they like the idea that a perp could be listering in on communications.... I bet they wouldnt like it. But here in NYC we have another problem with communications, buildings, & underground <subways and tunnels>. These new digital radios work through cell sites. These sites are placed or will be placed in subway and tunnels. These sites are not own by the department. Private corporations who sell this service to other goverment and non-goverment users lease these radios and they service the radios and cell sites. This is more cost efficient than one department or agency owning the system. This service is also being offered to the public in the new digital cell phone service. These radio-phones currently work in the 800mhz range set aside for cell phone service, current scanners are blocked from these freq/s and older scanners just dont decode these digital transmissions. And yes smaller departments are also looking into this new service, they can also save money by going digital and leasing the equipment. And even the public will save, some local cell phone providers are offering digital cell phone service, buy the phone <$99 and up> monthly rates same as regular cell phone, with no contract.

Years ago there was a B. Cheek article in Monitoring Times magazine about adding a wired remote to the 2006. I modified the functionality slightly and remotely control the following four functions: Search Up, Search Down, Scan, and Manual. There is more to it than adding wires to the keypad as the keypad is wired directly to the microprocessor. Hanging long wires on the microprocessor is not a good idea. The article used quad bilateral switching ICs to isolate the wires and switches from the CPU.

Monitoring Times should be able to sell you a reprint. Can't remember exactly when it was published.

Spoken like a Cellular Sales person.

Actually, it is very easy to prove, that the departments will not save by switching to Digital Cell phones, over conventional, trunked, or otherwise radio systems, be they digital, or analog.

It is also a fact that any department that depends on a system such as this, is setting themselfs up for big problems, the first time that there is a major problem, and the cell system gets tied up, or goes down.

John,
TrunkTracker has not undergone three software changes in the sense
I think you intend. The units in the field are engineering prototypes
intended for evaluation of the trunking algorithm, user interface etc.
Software mods at this level are just part of the development process and
not the same as changes introduced in the software of a released product.
The radio I have now, has what I beleive is the final or shipping version
of the software, unless I find some bug in the next few days.

I don't know where you heard about the ability to do trunking on any
frequency, but it's not true: TT will only decode trunking in the 800 MHz
range. Later, more expensive models may do 900 MHz trunking but not now.

Seems a little bit steep for a 100 channel scanner and the cellular mod
isn't too technically challenging either. Somebody call the Scanner
Price Police! <G>

Hi,

I am considering buying a pro-26, and was wondering about the cellular mod. Will modifying it cause any negative 'side effects' (ie loss of certain frequencies, change in reception ect)? Does it work well? I can get an upgrade cpu from Europe that has no blocked frequencies - is there any point to doing this as apposed to just modifying it the normal way (jumper wire on one of the chips).

Thanks a million.

Nah, it's too light for the boat anchor!
While the 8500 has some drawbacks, (such as trailing squelch after transmission and internal birdies,) I wouldn't condem it to the deep. Its reception sensitivity is more than adequate for urban areas. I routinely used it to cover P.D.s in a 30mile radius around my home with nothing but the telescoping whip antenna supplied. Not certain why Uniden pulled it off the market, but if it was for quality problems then why didn't they pull the 890 or their hand held replacement for the 200 off the market. Both suffered from the malady you mentioned. (A friends BC890 couldn't pull in a neiboring PD operating in the 475Mhz while my 8500 had no problem.) While I have not tried the 9000xlt, it better be much improved to justify its list price which it about $70 more than I paid for my 8500.

This may be because of concern by the military. Many of
the mil bases are on trunking systems now in the 70 cm
band. Also they have portable TRS. It would be a bummer
if the bad guys could follow mil TRS with a under $500
radio. Even the third world terrorists could afford that.

I don't have a copy of the Radio Shack scanner directory
at hand but check the back of it, I believe it lists some
of the common mil TRS frequency groups.

ALL scanners that have 800mhz reception on either side of the 869-896 and
820-849mhz CAN receive cellular stuff..it's just in thenewer ones they
have this "feature" turned off.
When I heard how the celular lobby bought congress, I bought several
expensive scanners..I how have 4 that can ALL receive EVERYTHING...
sometimes the cellular stuff can be interesting..like a live soap
opera..while others it can be boring......
I always caution people about giving out sensitive info on a cell
phone...I hav even foind a cell phone and givenmy scanner to someone
else...and said see this is a phone call to make my point....I know know
stranger's addresses, bank balances, credit card numbers etc...they
gave this stuff out over the air....no, I didn't writeit all down.
sometimes listening to cellular calls can be more entertaining that
listening to other scanner stuff.

it is NOT ILLEGAL to monitor cellular or cordless phones...those that like to make you think otherwise are associated with the lobby that bought congress...these laws have no teeth..they are not worth the paper they are printed on...I have never had to go to court or worse jail for something I enjoy doing all the time....people make this enjoyable because they will talk about almost anything on these devices!

COrdless Phones 49-50mhz and 46-47mhz range..lets throw in BABY MONITORS too these transmit EVERYTHING that they hear inside a room or house.

Cellular Phones can be interesting to listen to if one or both parties are not moving...if one of the parties in the conversation is moving (in a car driving) they usually will move to a new cell site and change frequencies...just when the conversation begins to get interesting.... you can search and find call on new frequency...someties it will still be there...other times they will have finished and have hung up.

hey..there was this guy (reported on the news) who used his cordless or cell phone to call sex lines and talk to his sex therapist....his neighbors heard everything..one neighbor told this guy that he was the laughing stock of the neighborhood...the guy attempted tosue the cellular and cordless phone mfgrs and the place where he bought the phone..... now I think he uses a land line to talk to his sex therapist.

Oh yeah..now that soneone heard NEWT G. we can cll this monitoring law stuff "newt's law.

Yes, I worked in Anaheim for several years andNOrth Hollywood after that.
lots of interesting stuff to listen to in OC....the comunication for all
police agencies sees to be handled centrally by the county...that's one
reason for the good comunication. I believe the comm center is in Garden
Grove near the Orange Crush (22, 5, 57 freeways)

Phoenix may have interagency frequencies but from what I have observed
they don;t seem to be used all that well when they are needed.

Every car/unit should have access to an interagency channel that they
could switch to to talk to/coordinate stuff with surrounding cities..
one problem is not all agencies are in the same band...some are 155, some
are 453, some are 460, and some are 856-8860 (trunked)
JOHN

Rich Barron (aaprrb@aol.com) wrote:
: Orange County has a red channel (among others) that are coordinated by
: the county dispatchers. Red channel is available to all local city and
: county PD's (not CHP to my knowledge). When a pursuit happens there is a
: red channel broadcast and the pursuit is called on red until it is
: terminated or goes out of the county. Since there are a number of cities
: in the county all mingled together there is usually pretty good
: interagency communication on things like pursuits, carjackings/stolen
: cars, robbery suspect info, etc. We also have regional air units
: (helicopers) that follow pursuits and coordinate the pursuits on red
: channel once they get on scene.
:
: Other than red channel each individual department has its own green
: channel for dispatch/records checks.
:
: County wide there are two tactical channels (Orange North and South) for
: longer term, localized interagency incidents (manhunts, hostage
: situations, etc) where they are involving extensive radio use and/or
: interagency communication. There is also a talk channel (car to car -
: white) and a few other incidental channels not often used (purple for
: records checks but they are usually done on green).
:
: Overall communication is pretty good, pursuits usually only involve two
: or theee units plus an air ship, and if weather is bad or the people are
: driving like nuts some or all units are requested to drop out and turn
: the pursuit over to another agency. We average a pursuit a day, but
: usually have them on the weekends.

Same experience here. Like another poster I leave it in the carry-on
bag rather than carrying it through the metal detector, No, there
are no "high-voltage magnets", whatever those are, or magnets period,
in the metal detectors; in fact there ARE high voltages and powerful
magnets, both, in the X-ray equipment, but neither will affect
scanners.)

At one airport (Philly) they wanted to hand-search my carry-on, not
being able to see through the laptop and its two spare batteries, and
when they noticed the scanner they asked me to switch it on and show
that it worked (just as they often do with the laptops).

By the way, if you fly often under circumstances where you HAVE to get
there: Monitoring the airline's maintenance channels while sitting in
the boarding lounge (or the airline's hospitality club) may get you
strange looks, but can often tell you about mechanical problems and
flight cancellations many minutes before they're announced, allowing
you to arrange for other flights well ahead of the rush. These few
minutes can be pearls beyond price.

It is not too difficult to modify various radios to transmit on police, fire and EMS frequencies in the VHF or UHF range. In fact, there are any number of radio modification "how to's" that are readily available that almost anyone with a basic knowledge of electronics can do to both portable (hand helds) and mobile radios. Many radio manufacturers design their radios for operation on a wide range of frquencies that allows these simple mods. Most of these radios also have CTCSS tones available (Motorola calls it PL tones) that enable the user to get on the air without any problem.

Fortunately, we do not have too many wackos abusing this, considering the ease of buying and modifying these radios. Most amateur radio operators (hams) have the ability to modify radios, however, this is not done frequently due to their knowledge of the potential harm someone could cause on public safety radio.

Yes there are a few people that do modify radios for their own strange desires, amusement or for criminal intent, however, this is a very small percentage of people compared to those that have the knowledge and ability to do so. Eventually, these people, like most criminals, screw up and get caught. When they do, they are prosecuted under federal law by the U.S. Attorney's office. Not a pleasant experience by any means. As well, the penalties range from $10,000 fines and 2 years imprisonment for unauthorized use of radios on public safety frequencies.

It may be better to find another hobby instead of horsing around on police radio frequencies.

Jim (K3WR)

If you have downloaded WinTone 1.5, and it is too slow for your system,
then you might want to check on the WinTone Web Page at :

www.frii.com/~rsmerker

There is a new version 1.51 that will be released on 1/5/97 that is 100%
faster than the old one, making it runnable on almost any 486!

I think you'll get the best use if you run seperate coax lines to your
shack and the use and ANTENNA SWITCH to bring one antenna or the other
into use at a time. Hooking both up at once could degrade overall
performance of both.

February 1997

Me again. This is a few days late...sorry about that.

Doyle sent a quantity of information this month. Weï¿½ll just dive right in and see what he has to offer. He says that in his neck of the woods (Larned KS) the KHP radio system still uses 70 Mhz for links. Also, near Great Bend, KHP can be heard on 72.080 (KFZ915). The 70 Mhz frequencies are used around Wichita, Garden City, and Hutchinson. Doyle listens to 453.750 and hears KHP from the Dodge City area. Another UHF frequency to listen to in Larned is 460.1125. Doyle says it booms in there. (It used to be used around Topeka, but was abandoned once 800 took over that area...Andy)
Speaking of the stateï¿½s 800 system, he has heard that troopers from Great Bend talk to Wichita on their 800 system, but he has doubts because he hasnï¿½t seen any 800 Mhz antennas on the cars. He hears most of them going through Barton County dispatch or Wichita State on low band. Doyle, they might not have any mobile equipment yet, and may simply be using portable radios. That was the case here in Johnson County for a while, so they may indeed be using 800 for that purpose.
The following list of link frequencies to the State of Kansas comes from Doyle. If some of you in those areas would monitor them and report what you find, itï¿½d be appreciated.

KHP aircraft was a topic of Januaryï¿½s column, too. Are they still
on low band??? Doyle says yes. They have no other radios available. (I
suppose they could borrow 800 Mhz portables if they were in areas served
by 800 systems, but who knows...Andy.)
Last month we had some information on Hoisington, and Doyle has
some more details for us. When Barton County went to 911 dispatch, all
departments had to go to 453 Mhz. All county FD/EMS units are on now on
453.400, which left 460.600 empty. Barton County Sheriff/KHP and small
towns use 453.150 for the main channel. Small towns like Chaflin,
Ellingwood and Hoisington have their own frequencies for local chit/chat
or local dispatches.
Here is Doyleï¿½s list for Barton County:
453.050 ch 2 Great Bend PD
453.100 main City of Hoisington
453.150 ch 1 Barton SO
453.200 main Barton County Community College
(Doyle says a new 100 repeater is in the works. BCCC is currently
simplex, so unknown if it will stay on this freq.)
453.300 jail Barton SO
453.400 page Countywide EMS-FIre
453.550 street Dept. City of Great Bend

453.575 main Claflin PD
453.650 ch 2 Barton SO
453.750 main Ellinwood PD
453.800 ch 3 tac Barton SO
453.850 ch 1 Great Bend PD
453.950 fire Great Bend FD
460.600 main Hoisington PD

Doyleï¿½s list for Pawnee County:

155.100 city utilities, paging for FD/EMS/Rescue
155.745 law enforcement, FD/EMS
155.145 Larned PD tactical channel
158.805 Larned PD alternate channel (simplex)
155.475 Larned FD (portables only)
155.805 Larned State Hospital (simplex)
453.875 Burdett FD/EMS with phone patch
462.950 EMS to St Joseph Hospital
463.075 EMS with phone patch
463.150 EMS calling CKMC (Great Bend)
155.955 Pawnee County Road Department
851.0375 YCAL, Larned State Hospital (not used
much)
155.310 Larned Correctional Facility (DOC)
155.205 USD 495 bus & maintenance

Doyle, thanks for the large amount of information. We all appreciate it.

Bob, sent some info on some military aircraft frequencies. He
monitors from the Tonganoxie area. This is the actual message he sent to
me. "I did note that 41.700 f.m. is still being used fairly consistently
by Kansas Army National Guard choppers. Forbes uses the callsign
ï¿½Sunflowerï¿½ with them. 241.000 MHz a.m. is also frequently heard in use.
Also 46.900 f.m. is still being used from the JoCo airport for Army
Reserve Chinooks."

"Some of the local military freqs. I've been hearing the past week
or so:
41.7 ï¿½Sunflowerï¿½ KS Army N.G., Forbes, Topeka. (f.m.)
46.9 USAR chinooks from JOCO airport. (f.m.)
126.2 various military flights using civil towers.
241.0 KS Army N.G. flights. Occasionally active.
286.5 190th ANG refueling grp. from Forbes in Topeka. Active.
316.9 Smokey Hill bombing range. Fairly active.
321.7 Ft. Leavenworth, pilot to dispatcher. Occasionally active."

Thanks to Bob, as usual. (He always has some neat stuff to
share!)

For what it is worth, the chinooks Bob mentions fly right over my
house on a regular basis. They often carry what appears to be a big
cement weight from a sling. With my luck, they will drop the weight and

crush my Suburban, or it will come through the ceiling of my living room. I monitor them all the time, and I am waiting to hear them say "OOPS" and then hear the loud crunching sound. Itï¿½s enough to give someone a nervous tic.

Last for this month is a submission by David. He has sent a comprehensive list of government frequencies. No doubt some of the transmissions are digitally scrambled, but there is still lots to be heard in the clear. Keep them loaded in the radio and report your findings. Good list, David.

I have two Pro-51's unmodified for $140 each. This includes shipping
within 48 states. Both are in good shape with copy of manual. These are
200 channel scanners with freq range of 29 Mhz to 956 Mhz (approx).

Uniden 100XLT, 100 channel scanner with freq range of 29 Mhz to
512 Mhz (Approx). Works good. Nicad is in good shape. I don't
have the 12v wallwart. Any 12 VDC wallwart will work fine.
$85 includes shipping with 48 states.

I have a Comet CH-72S rubber flex antenna with BNC connector for trade. It is a 5/8 wave on 445 mhz and 1/4 wave on 146 mhz, approximately 15" overall length.

Great for dual band handheld or handheld scanners. Great out of band coverage.

I would like to trade for a Miracle Baby or Optoelectronics DB-32 antenna. It is a mini-duck type antenna about 2" tall.

> You're an arrogant mental midget. If you've never heard of an Alexander
> Tri-Analyzer, you sure as hell aren't anything resembling a professional.
> It's made SPECIFICALLY for Ni-Cads you dolt!

> Ken,

I have seen your posts in the past and you are again par for the
course.The maxim of giving a dope enuff rope.............

Have some more spinach, Popeye! Hmmmm...in truth, I don't know whether to react to your perjury or your peril.Let's take your "perjury" first....I have read your response a few times over and you didn't respond WHATSOVER to any of my points. However, YOU did manage to prove yourself as the arrogant name-dropper once again. Keep your pissing contests and your curriculum vitae to yourself, Kenny. And yes I have heard of the Alexander's. Who cares? It is COMPLETELY EXTRANEOUS TO THE BYLINE Have you heard of Seatons, DCH or Elsingtons? See, I can play your "game" too! I was being fecetious originally but that eluded you. Were you deprived of cartoons as a child?,!

Now, let's take your "peril".....It always amazes me to see how **brave** people get behind a keyboard with namecalling and the like. Calling somebody a "dolt" and "asswipe" is about as assinine as it comes. What a cheapshot artist! If you EVER said that to my face you'd come close to getting a few choice shots to your chin, buddy boy. Can you say "spitting out your chiclets"?
You remind me of a drunkard who uses a lamp post for support and not illumination. DO YOURSELF A GREAT FAVOUR AND AT LEAST HEAR THE TESTIMONY OF THE REAL EXPERTS!! Post to the rec. woodworking as I have said and learn.

> You say you don't have time for intellectual wannabe stuff? You have no
> idea who I am or what my credentials are asswipe! Care to bet who has the
> most electronics education, background and experience?
>

Ken, *sigh* you shit and whine like a seagull.....First off, YOU DON"T EVEN KNOW WHO I AM!!. Are you THAT arrogant to think that you were THE ONLY one to manage to get an education on this planet? Look up "hubris" in the dictionary.It'll do you great wonders and might get you away from behind the counter. You remind me of a fella also named Ken that I worked with that got the constant derision of many other engineers up there by getting all "credentialed-up" to prove any damned convuluted point. Still, I wonder whatever happened to that boneless wonder!!I am wondering though if you were the same Ken I worked with in the early 1980's up in Churchill when I was doing contract work with Black Brant rockets? Stow it, tough guy! Go pop a zit, ZIPPY!

> You even acknowledge Ni-Cads made since '88 have been re-engineered!
> I SAY AGAIN, one of the Engineers who developed modern Ni-Cads said
> in an article in Mobile Radio Technology that MEMORY EFFECT NO LONGER
> EXISTS! Get it throught that thick head!

Ken, now your talking my language! For the record, I was wrong about the years. The Ni-Cad R & D came about in 1992 but essentially the tenets remain the same. I thought you said it was a myth. Ken?, I know myths become facts but how, praytell,does fact become myth? I'll take the Occam's Razor here: "MEMORY EFFECT NO LONGER EXISTS!" means what exactly.......did somebody debunk it like your Mobile Radio (whatever!) article or was it like a sulfa-drug cure in Nicad Technology. Please clarify Kenny. I will state again. IT EXISTED THEN,IT EXISTS NOW!
>

> You have heard of Mobile Radio Technology haven't you? HELLO?

For brevity's sake and civility I will not repost to you in public unless you can offer SOMETHING worth more than a magazine clip-out. If you are truly in pursuit of truth and knowledge, you mare-mail me privately to address my still unanswered points.In the meantime, you have been great fodder for the office banter here this morning with the field "techs". Congrats, Ken! You were the office joke-of-the-day! Go soak your head, ditch that Farmer's Almanac article" of yours and pick up the Yellow Pages in your locale and call up UP ANY SEASONED contractor that works with Ni-CAds and LISTEN TWICE and SPEAK HALF...you might learn something a little more empirical than an "article".....

I need a list of the color dots and their corresponding frequencies,
i.e., green dot=154.600, etc... I really need brown, but a whole list
may come in handy for me in the future.

Thanks!

>
> Nick Marsh
> WB4SQI
>
> Ashland, KYWhat the dispatcher was referring to is "NLETS", pronounced "En-lets", an acronym for National Law Enforecement Telecommunications System. It is the system, switched through New Mexico (or AZ, I can never remember) which allows police agencies in one state to query driver license and vehicle databases in other states. You may hear them refer to a DQ (driver's license query) or RQ (registration query) associated with these checks. It also allows for AM (administrative messages) between agencies regarding help on deciphering codes used in other states' criminal histories, or driving histories, or about extradition on warrants. In contrast, NCIC pretty much only holds files about extraditable warrants and serialized stolen property, with specific expiration dates for those stolen files. A "hit" on an NCIC warrant from us in Alaska, for instance, would be followed up by several specifically formatted messages between us and the police agency in, say, Georgia who had contacted a defendant who had a felony warrant we'd entered into NCIC. Sorry this got so windy; my wife tells me that when people ask me what time it is, I tell them how to build a clock. Comes from 9 years as a dispatcher following 19 yrs as a paramedic/firefighter. Hope this helps.

Lorin: Shouldn't be much of a problem at US airports. I've gone in with my hand-held transceiver (ham radio dual-band type) and have just had to turn it on to show them that it's not a bomb or anything (same as you do with a portable computer).

On 3 Feb 1997 18:45:37 GMT, playhaus@news.gate.net (Lorin Winchester) wrote:

One stupid design flaw I see with the BC-9000 is putting the EXT Speaker Jack on the
front of the unit. I always use an external speaker for improved audio, and it sure
looks sloppy with the wire hanging in front of the unit. Why didn't they mount the jacks
in the back like most scanners?

You may want to check the ScanWare files for NY to see if they
are listed.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5100
33.4000 --- 154.5400
35.0200 --- 154.6000
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

These are all the frequencies that you should search if you
can't can get a hit on the common pairs:

FREQUENCIES TO CHECK FOR FAST FOOD RESTAURANTS

VHF-low:

30.7600 30.8000 30.8400 30.8800 30.9200 30.9600 31.0000 31.0400 31.1600
31.2000 31.2400 33.1400 33.1600 33.4000 35.0200 35.0400 35.0600 35.0800
35.1000 35.1200 35.1400 35.1800 35.7000 35.7200 35.8800 35.9000 35.9200
35.9400 35.9600 35.9800 42.9600 42.9800 43.0000

VHF-high:

151.6250 151.6550 151.6850 151.7150 151.7450 151.7750 151.8050 151.8350
151.8650 151.8950 151.9250 151.9550 154.5150 154.5400 154.5700 154.6000
169.4450 169.5050 170.2450 170.3050 171.0450 171.1050 171.8450 171.9050

UHF:

457.5125 457.5250 457.5375 457.5500 457.5625 457.5750 457.5875 457.6000

>>Does anyone know where I can find a listing of San Antonio
>>frequencies?

Your local Radio Shack store probably has a printout of local agencies'
frequencies for you...there's about a dozen stores in your city.

339. RE: Bearcat scanners at 160mhz??

>>I am trying to scan the railroad frequencies around
>>160 mhz...which would be most appropriate for the 160
>>frequency...

What a refreshing Message, Arnie! You have done your homework and have discovered WHAT you will mainly be using your Scanner for! You are to be commended...usually we have "What's the BEST Scanner?" type of questions, which I reply with my normal, "Hey - what do YOU want to listen to?" speech.

Unfortunately, though, I cannot answer your plea for information. But I am sure that others here know these models more intimately than I do, and will Reply.

Let us know what you purchase and how you're doing!

Clint Bradford, KE6LCS/KAF3359 909.681.6210 Voice sysop@atdbbs.com

Twice in the past three days I have replied to folks here with requested information. Both times it involved them sending me private EMail asking for a copy of Bob Parnass' EXCELLENT article on "How to Find Scanner Frequencies." I publicly offered a copy of Bob's article to these "new participants" in case they missed them last week.

ANYWAY - these two participants EMailed me that they did, indeed, miss Bob's posts last week. And so I GLADLY EMailed them a reply with the article attached. Did my "scanner enthusiast Good Deed for the Day" and went about my business.

BOTH of my messages were returned - 'cause the addresses used to EMail me were bogus.

Hey, folks - if you want information sent to you, at least have the COMMON SENSE to send requests with your REAL ADDRESS, OK?

No, I am not bitter...just amused. I *have*, though, stopped responding to those who use obviously bogus addresses. MANY times in the past few months I have had EXACTLY what a poster was looking for...but with that b.s. "cute" address, it just isn't worth my time and effort. Respect your Scanner peers - we're all here for good information. We're not here to deceive.

Back to scanning!

-Clint Bradford

Rich,

You're an arrogant mental midget. If you've never heard of an Alexander
Tri-Analyzer, you sure as hell aren't anything resembling a professional.
It's made SPECIFICALLY for Ni-Cads you dolt!

You say you don't have time for intellectual wannabe stuff? You have no
idea who I am or what my credentials are asswipe! Care to bet who has the
most electronics education, background and experience?

You even acknowledge Ni-Cads made since '88 have been re-engineered!
I SAY AGAIN, one of the Engineers who developed modern Ni-Cads said
in an article in Mobile Radio Technology that MEMORY EFFECT NO LONGER
EXISTS! Get it throught that thick head!

You have heard of Mobile Radio Technology haven't you? HELLO?

You may want to check the ScanWare files for NY to see if they
are listed.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5150
33.4000 --- 154.5400
35.0200 --- 154.6000
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

These are all the frequencies that you should search if you
can't can get a hit on the common pairs:

FREQUENCIES TO CHECK FOR FAST FOOD RESTAURANTS

VHF-low:

30.7600 30.8000 30.8400 30.8800 30.9200 30.9600 31.0000 31.0400 31.1600
31.2000 31.2400 33.1400 33.1600 33.4000 35.0200 35.0400 35.0600 35.0800
35.1000 35.1200 35.1400 35.1800 35.7000 35.7200 35.8800 35.9000 35.9200
35.9400 35.9600 35.9800 42.9600 42.9800 43.0000

VHF-high:

151.6250 151.6550 151.6850 151.7150 151.7450 151.7750 151.8050 151.8350
151.8650 151.8950 151.9250 151.9550 154.5150 154.5400 154.5700 154.6000

I recently had a 235xlt TRUNKTRACKER in my hands. It will not scan trunked 450 mhz band or 900mhz trunked systems. Police only use the 800mhz band where this scanner performs trunk tracking flawlessly (Motorola analog systems only) It will sell for $265 through the BEARCAT SCANNER CLUB.The 895 will sell for the SAME price according the president of the club and owner of HOBBY RADIO in Kettering Ohio.It will be available in the summer of 97. The 235 will be available by April.bearcat is reportedly working on an EDACS model as well.

344. London England

I will be going to London in a few months and was thinking about taking my scanner. Are scanners legal/legit in England? What about ones that get 800 freqs? Is there a good site that might list London frequencies for law enforcement, fire, media, etc?
Thanks
Marg

February 4, 1997

Dear Readers:

I am taking French II. And, I want to be able to listen to some French-speaking shortwave radio stations that are broadcasting clearly from 0500-11:00 GMT and 16:00-22:00 GMT. Around these times, when it comes to the French language, shortwave is an empty wasteland of either no French at all or signals that are so weak it is too frustrating to listen to them.

Thank you,
Joe
aka robert113@delphi.com

WELL HERE GOES!!! I'm sure I'll get harassed like crazy for this...
Well, I got the mod to work.... FROM 50-999mhz.... NOW heres the
problem.... I CANT TRASMIT anywhere.....The ptt light doesnt even
light up... When I hit my 'knob' button to make settings and you're
supposed to hit PTT to confirm & save it... I have to hold the KNOB
down to save it.... I'm sick.....I should've left well enough alone!
CAN ANYONE HELP ME?????? PLEASE??????? I've learned my lesson!!!

If I can just get it to transmit where its supposed to I'll he a
happy ham!!

THANK YOU!!

MARK WATSON

Just curious about this one. I was looking through the list of Dallas PD signal codes that's linked from http://www.policescanner.com and I noticed that 17, 43, and 45 through 49 are not listed there. Do these signals not exist, (I seem to recall hearing a signal 17 once, but I might've misheard it, or it could have been on one of the business freq's) are they omitted by mistake, or are they stuff we shouldn't know about? (Considering the ones that are listed, I can't think of anthing particularly sensitive that might have been left out)

Also, out of curiosity, why do different departments use such different signals? (I'm used to a small town that used the extended 10-codes)

Copy and distribute to your news groups!

Phone Co. Wants Internet Surcharge!

Subject: FCC Imposed Charges... IMPORTANT - READ THIS!

To my internet friends,

I am writing you this to inform you of a very important matter currently under review by the FCC. Your local telephone company has filed a proposal with the FCC to impose per minute charges for your internet service. They contend that your usage has, or will, hinder the operation of the telephone network.

It is my belief that internet usage will diminish if users were required to pay additional per minute charges. Since a lot of our business is done on the internet, this could affect us greatly.

The FCC has created an email box for your comments, responses must be received by February 13, 1997. Send your comments to isp@fcc.gov and tell them what you think.

Please forward this email to all your friends on the internet so all voices may be heard.

Thanks for your time,

I just took a east coast to west coast trip, and had a padded bag full
of ht's scanners, radar detector, and other stuff. Another bag was
full of camera gear. I put it through the x-ray, carried it on, and
was never asked about it whatsoever. no one checked the bag, or asked
what was in it. Had a cell phone in there with extra batteries, and
another two way radio also.

this was carry on luggage. (I wont let someone else handle it)

I didn't/wouldn't turn anything on while in flight though.

Dan

in other words, they dont care if you bring the stuff on board.

there are always so many questions that are asked here, where the
answers are readily available from many other sources. I do not mean
to demean any one for asking questions, because there is no such thing
as a stupid questions, only stupid answers :} And I have seen many,
many nice people here kindly answering these questions.

I thought that maybe someone would be interested in my "at hand"
library, that is, within easy reach of my scanners and computers. I
think that these publications are absolutely mandatory for the serious

Scannerist., at a minimum. In addition, I also have several CD's,
such as the Percon, QRZ (Ham database) and Groves CD. So,
In no particular order, here they are:

Monitor America, SMB press
California Vehicle Code, West Publ.
California Penal Code, West Publ.
Confidential Frequency List, Ferrell, Gilfer press
Federal Government Frequency Assignments, Art-Sci
The Satellite TV Handbook, Easton Press
Area 51 Viewer's Guide, Campbell
R-2508 Complex User's Guide, FAA
Police Call, Radio Shack
Lost User's Manuals, Art-Sci
Uniden Betty Bearcat Frequency Directory,
The Packet Radio Operator's Manual, CQ Communications.
The Worldwide Aeronautical Communications Frequency Directory,
Evans
Guide to Aeronautical Communications, CRB Research
Aeronautical Frequency Directory, Rob't Coburn
Military Monitoring, Douglass
Top Secret registry of US Gov't Radio Frequencies,
CRB Research
The ARRL Antenna Book, ARRL
The ARRL Handbook., ARRL
Black's Law Dictionary, West Publ..
Pilots guide to California Airports.
Flight Guide, Western Airports, vol 1
ARRL Repeater guide.
The Scannerist, Ron Cheshire
And last but not least, , ,
Leonard Maltin's 1996 Movie & Video Guide

I have found many answers in these great books. I hope that this will help some of you who may not know where to start.

This past weekend there was a posting inquiring as to whether Optoelectronics was still in business. Well, we are alive and well.

In the past year we have been doing more business factory direct and that policy made a few of the distributors upset. Apparently one of our former distributors gave the impression that we were out of business.

Sorry for any inconvenience this may have casued.

Sincerely,

Kevin Cox
Director of Operations, Optoelectronics, Inc.

Bill,

I also think the MR-8100 was a pretty decent radio (I have three).
However, if you live near a transmitter site (paging, in particular),
you will note some susceptibility if you're within 1/2 mile, or so. A 10
dB attenuator in line with the antenna will help a great deal.

I have the software required to program the radio via my Web site:

http://ourworld.compuserve.com/homepages/Scan_PikesPeak

I have also attached a review I did of this radio.

$200 seems like a lot to pay. $100 or $150 (in top condition) seems
more reasonable. Make sure the speaker and mounting bracket are
included, as Uniden is starting to run out of this stuff.

Ken WA6TTY

MR8100 Scanner Review

by Ken Wyatt, WA6TTY

(Revised 9/5/96)

Overall: This is a well-built and laid out scanner
which was designed with input from the California Highway

Patrol. The enclosure is made with cast aluminum and there are numerous internal shields to isolate the various sections of the receiver. It covers all the usual public service (plus 800 MHz), aircraft, and government bands. The only exception is the military aircraft band (240-400 MHz). The radio is about the same physical size as other mobile scanners, but all the controls are mounted on what would be the normal "top" surface, leaving plenty of room for oversized controls, along with a large alphanumeric display. The radio includes 100 channels arranged in banks of 10 and the scan rate may be toggled between either 35 or 100 ch/s. The audio is clean, with three watts of power; adequate for the inside of a dump truck! The radio must be mounted against a flat panel or on top of a floor-mounted system and will not work for the typical under-dash configuration. The radio does not have a built-in speaker, but comes with a remotely-mounted one. Scanner World also supplies IBM-PC programming software (on 3 and 5.25 disks), along with an interface cable. {See note below}

Controls: The radio includes all the usual controls. Missing is a scan search/store feature and the capability to -not- delay a channel. The user may program frequencies, lock out channels, and manually step through programmed channels from the front panel controls.

Display: The display is a large (about) 20 character alphanumeric type with variable backlighting and contrast. It displays the channel number, and either the frequency (to four significant digits) or a user-programmed alpha name (upper/lower case). Unfortunately, while the display indicates frequency out to four decimal places, the firmware only accepts three decimal places for PLL programming. Thus while you -think- the radio is tuned correctly to one of the "splinter" channels, it's not.

Computer I/O: Yes, this radio may be programmed via an RS-232 port! Software is included to program frequencies, name channels and banks, and set prioity channels (one per band). Scanner World supplied the wrong cable, but those who use the (typical) DB-9 connector (COM1), may simply purchase a "straight-through" 9-pin to 9-pin cable. The frequency (scan) list may then be stored and retrieved from disk. The cellular channels are unavailable via the front panel, but the software allows programming these if you enter the correct password, "ECPA1986"; would you believe! Connection of the scanner must be made to the COM1 port of your computer (not mentioned in the manual).

New MS Windows-based programming software is currently under development and preliminary copies may be obtained via AOL or CompuServe in their ham radio areas. The filename is "PSCAN.EXE". It's really slick!

Performance: The radio performs fairly well, overall. The sensitivity is on par with similar mobile scanners. The receiver IS susceptible to strong signals, such as paging transmitters. This results in an intermod problem where either paging tones will come through or signals will be received that you aren't tuned to. For me, this only occurs within large metropolitan areas, and only in places of high level rf energy. For example, within Colorado Springs, I have run into maybe five or six "bad" localities. At least 95% of the city is OK. As a first trial at solving this, I placed a variable step attenuator in line with the antenna. Usually clicking in 10-30 dB will do the trick, and doesn't impact reception of stations that much. I have also tried Grove's Scanner Filter and while I'm sure it would help if the receiver was overloaded by broadcast stations, it does little for the variety of paging transmitters in this area. The step attenuator seems to work the best and is what I'll use for my permanent installation. I wish the radio had a built-in attenuator like the PRO-200x series.

Summary: The scan rate of 100 ch/s is wonderful. I am usually able to catch the first syllable of a transmission, unless there is multiple traffic occuring. I don't know why one would wish to scan at it's lower rate. The audio is clean with plenty of punch. I find that permanently leaving 20 dB of attenuation between the antenna and radio gets rid of the bulk of intermod problems, while still allowing good reception. I like the fast scan rate and having banks of 10 channels is really convenient if one travels through different areas, or wishes to lock out complete services, etc. I travel a lot, and find it very conveneient to be able to upload a new set of frequencies/channel names every time I enter a new state. I use my HP 100LS palmtop computer for this task; keeping a host of frequency files loaded in memory.

Pluses: Good clean audio
100 channels in 10 banks
Fast 100 ch/s scan rate
Alphanumeric channel information
Large readable display
Programmable by computer
Ruggedly built

Minuses: Low-to-moderate problem with intermod
Only choice is a 2 second scan delay
Awkward mounting; no under-dash install. possible
No search and store capability
No military aircraft band

Available only from Scanner World, $289, plus $10 shipping.

NOTE: As of three years ago, Scanner World ran out of these. Occassionally, they may be found used on rec.radio.forsale.

MR> Yaeh, but I think they called OJ. Does that mean the LAPD has a
MR> right to violate the federal law and release the tapes to the public.

All calls in and out of the comm center are taped.....intercom to
other agencies, phones, radio channels. They have been since the
beginning of time.....it's not something new with 9-1-1. You should
see the banks of 16-channel (or more) recorders spinning and taping
24 hours a day, with PacBell time of the day recorded on a channel.

Federal statute specifically exempts police and fire departments.
There was == NO == violation of any law.

And under the California Freedom of Information Act they are a
public record (except certain information which, if released,
would hinder or compromise an investigation).

You should understand what you're talking about before opening
your mouth or typing and making a fool of yourself, especially
when making false accusations.

Even with homes and other phones, digitals can go 1000 feet, 900 is
about average. I recommend the Sony SppD900 or whatever it is. I payed
$100 for it at Sun TV, others sell if for approx $170.

DR> scanning?

Yes, thanks the gods. ALL PCS phones are digital. Once people go to them,
there won't BE any debate on monitoring, or any offers of $500 for a Pro2006.
Until someone breaks the digital encryption, that is.

... Blessed are the censors for they shall inhibit the Earth.

Danny,

Sorry, but there is no demo. I just got it, and it looks pretty good thus far. Much faster than anything else. Dos based though...

Good luck,

Our neighborhood was trying to get a drug house that even offered curb
service shut down. We would watch and alert the police when there was
activity going on, but they must have been monitering the calls ,
because they would load up and clear out just seconds before officers
arrived on the scene each time. They finally shut them down, but it was
a long time coming.

Well, not myself. BUT...lem'me forward this to the scanner-related Usenet newsgroups and that should almost assuredly get you that information. Sorry that I couldn't help you with that personally, though. I just don't know, myself. [To anyone reading...please respond directly to Jan's e-mail address above.]

> greetings from a freezing cold hamburg,

Ick! I hate it when you bite into one and you hear that crunch and realize it's your teeth falling apart because they forgot to thaw the darned thing. Don't you?

Oh...oops. You meant your FROM Hamburg, Germany. Sorry about that. I knew that all along. <joking> 8-)

I can sympathise. I used to live a little farther north, in New Jersey, when I was a kid. I think the temps used to get down sometimes to about 15 degrees. Combine that with the high winds of the ocean community I used to live in, and that's pretty cold.
Since moving down here to Fla., I've lost my "winter coat", so-to-speak, and can't handle the cold anymore like I used to. Slightest little breeze and I'm crying for a jacket now. :)

Take care,

You probably hear him say NLETS - National Law Enforcement Teletype System.
It is basically a network for state computer systems to send their computer traffic to a computer in Arizona. From there it goes across the country. If a New York state police department sends a message to a police department in Michigan, it goes: New York to Arizona to Michigan... There is no direct connection to each state from another state. The NLETS system is unlike the Internet...if NLETS goes down...states dont talk to each other over the computer...

Just for safety I put my scanner in a carry-on bag, and put it through the x-ray machine instead of walking through the metal detector. I don't think high voltage magnets are too good for the scanner.

You may be questioned if you take out your scanner in mid-flight (when they allow people to use laptops, etc.; I usually just ask the stewards if I can operate electronics). You'll get the classic "that isn't a cellular phone, is it, sir?" when you whip out your scanner. Just tell 'em "oh, this, no; it's an AM/FM radio, like a walkman". Works every time... :)

Hello,
I have available a Radio Shack PRO-2032 200 channel base scanner.
The date code is 7A3 making this radio modifiable.
The radio covers the following frq ranges: 30-54; 108-174;380-512;
806-823.9375; 851-868.9375; 896-960
Its in good condition(not used often). While the supplied antenna is
slightly bent, it does not affect its performance. in addition there is a
BNC connector on the back.
-Original manual, box, packing materials
-2 second delay, priority, direct search

Asking: $150 (postpaid)
I will ship UPS the day after I receive your check.

Contact: The Mik111@aol.com OR lugey@ix.netcom.com
(e-mail is the best way to contact me, I am not home much, thus my reason
for unloading the radio)

Thanks
Michael J Miller
Queens NY

>... is part of a page dedicated to the television program.

Jeff:

Thanks for being so helpful. The LAFD website offers a -link- to a
webpage dedicated to the quarter-century old televison series EMERGENCY!
You can link to that -independent- page (and its .wav files) by linking
through the LAFD Gateway page at:

http://www.ci.la.ca.us/dept/LAFD/otherurl.htm

Scroll down to the "Miscellaneous" section and you will see the link.

For reference, I must remind those here that the LAFD is -not- the agency
portrayed in the television series EMERGENCY!

For clarification sake, the acronym "LAFD" is appropriately used only
in reference to our agency, the 110 year-old Department that provides
life safety services to the citizens of the --City-- of Los Angeles. Yes,
the LAFD is the one and only "Los Angeles Fire Department", or as some
people prefer to call us, the "Los Angeles CITY Fire Department".

EMERGENCY! featured the exploits of a fictitious pair of Los Angeles
COUNTY Fire Department Paramedics. That fine Department is a separate
agency and does not yet have an Internet presence.

The .wav file at the LAFD website you mentioned is not related to the TV
series. It is simply a 38 second recording of the famous Crown fire
apparatus responding to an incident. It may be found at:

http://www.ci.la.ca.us/dept/LAFD/crown.htm

Please let me know when you will be in Southern California. I would hope
at
that time to provide you with the opportunity to meet first-hand with
the
men and women of the Class 1 rated Los Angeles City Fire Department.

Brian Humphrey
Firefighter/Paramedic
Public Information Officer
Los Angeles City Fire Department

The military does use motorola type II on the 406 -418 band. The
controllers and the programming software are the same as the 800 meg.
The 900 meg meg systems are 12.5 kc and utilize amplitude companding
or "hear clear" which means even if the scanners can track the
talkgroups you will need to turn up the volume to hear the 2.5 kc
deviation. Much of the 900 meg traffic around San Diego uses the
Johnson format so couldnt be tracked anyway with a bc235.

The law on this subject is different in each state. In Oregon a case
againsted the City of Lake Oswego, OR. went to the State Supreme court
. A DWI driver went downstairs of the courthouse where the Police station
is located and used the courtisy phone to talk to the dispatcher. On the
phone he stated he had just wrekced his car and that he walked directly to
the station. The defense to the DWI charge tried stating his admission to
driving was inadmissable......Well the SUPREME COURT said that as long as
one party is privy that the call is being recorded it can and WILL be used
in court.

Just for info, in Washington State BOTH sides must know in order to be
used in court, mind you these two examples are not subject to a court
order which would obviously over rule them.

: Excuse me for a blunder I have made here before: what I said applies
: in Texas, I am not familiar with the laws in other states. In Texas, if
: one party consents, whether they tell the other party/parties or not, it
: can be taped (and used in court). See Texas Penal Code Chapter 16.02
: section (c)(3) "...if the person is a party to the communication or if one
: of the parties to the communication has given prior consent to the
: interrception."
:
: Again, sorry for the misstatement.

It's the whole desire to sell the metal hy-drox-side batteries (forgive
the spelling this late at night :-). Nicads are great. I have been using

the same set now for 3+ years.

I wish that I could agree with Glen on the Renewal alkalines. I get worse service than nicads. Seems like everytime I load a radio with them, I discharge them in about 1/2 the time of the nicads. I may have gotten the x-mas rush bad batch however. The charger is nice since it does 8 batteries rather than just four like the nicad charger does. Ok I tried them. Din't like them. But hey, I am just an old fart too stuck in his ways to change now.

Glad to see the good words about nicads...

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4
months. think about it. You see those 'Make.Money.Fast' posts more

and more. That's ... because it WORKS! So I thought, all those new
users might make it work. And I decided to try it out, a few months
ago.
Besides, whats $5.00, I spend more than that in the morning on my way
to work on coffee and cigs for the day. So I sent in my money and
posted.
Everyone was calling it a scam, but there are SO many new users from
AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began recieving bucks in the mail! I
couldn't believe it! Not just a little, I mean big bucks! At first
only a few
hundred dollars, then a week later, a couple of thousand, then BOOM.
By the end of the fourth week, I had recieved nearly $47,000.00.
It
came
from all over the world. And every bit of it perfectly legal and on
the up and up. I've been able to pay off all my bills and still had
enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well.
Markus Valppu says he made $57,883 in four weeks. Dave Manning claims
he
made $53,664 in the same amount of time. Dan Shepstone says it was
only
$17,000 for him. Do I know these folks? No, but when I read how they
say they did it, it made sense to me. Enough sense that I'm taking a
similar chance with $5 of my own bucks. Not a big chance, I
admit--but one with incredible potential, because $5 is all anyone
ever invests
in this system. Period. That's all Markus, Dave, or Dan invested, yet
their $5 netted them tens of thousands of dollars each, in a safe,
legal, completely legitimate way. Here's how it works in 3 easy
steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate
piecesof paper along with the words: "PLEASE ADD ME TO YOUR MAILING
LIST."
(In this way, you're not just sending a dollar to someone; you're

paying
for a legitimate service.) Fold a $1 bill, money order, or bank note
inside each paper, and mail them by standard U. S. Mail to the
following five
addresses:

1- Victor Chen
2021 Hearst Ave
Berkeley, CA. 94709

2- Steve Boltinghouse
1009 Bird St.
Hannibal, MO 63401

3- Soonhee You
4/2,409-23,
Shindang-2dong
Jung Gu,Seoul
KOREA

4- IN JA CHANG
6220 Shelter Greek LN
San Bruno CA. 94066
USA

5- Moon H. Shin
750 Gonzalez Dr #M/C
San francisco, CA 94132
USA

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or

money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to
keep an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass

it along to someone you know who really needs the bucks, and see
what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY !!!!!!!!!!

399. Re: LAPD Air UNIT

Newsgroup: rec.radio.scanner

LAPD airships use both the regular semi-duplex repeater Dispatch channels, there are 18 of them, by the way... Or, they sometimes go to simplex mode on the Dispatch channel to talk to the units on scene, and the repeater input will pick this up so the dispatcher can hear... OR, he could be on what's known as Tac-1... Some of the airships communicate with the dispatch center on Tac-1(always simplex), as well as with other airships... Just for info, Tac-1 is also more commonly known as the "Hot Shots" Channel, where all priority calls citywide get broadcasted....

I picked it up a couple of weeks ago om alt.radio.scanners newsgroup and
send it as is!
==========

Greetings one and all,

Have you ever lusted to decode Mobile Data Terminal (MDT)
tranmissions? Have you ever wanted to see the same NCIC and motor
vehicle information that law enforcement officers see? Have you ever
wanted to see what officers send to each other over "private" channels?
And all this with an interface you can build with only a few dollars
worth of parts from your local radio shack?

If so this posting might be your rendevous with destiny. The tail
end of this posting includes the source code of a program that decodes
and displays MDT messages. It stores roughly 30k of messages in a buffer
and then writes the whole buffer to a file called "data.dat" before
terminating. The program may be interrupted at any time by pressing any
key (don't use control-c) at which point it writes the partially filled
buffer to "data.dat". This program only works for systems built by
Motorola using the MDC4800 tranmission protocol. This accounts for a
large fraction of public service MDT systems as well other private
systems.

The existence of this program is ample evidence that Motorola has
misrepresented its MDT systems when it marketed them as a secure means
of communcications. The interested reader will soon discover that these
systems do not use any form of encryption. Security concerns instead
have been dealt with by using a code. "And what might this code be
called?" asks the reader. The code turns out to be plain ASCII. What
follows is a brief description of how the program and the MDC4800
protocol work. If you don't understand something go to your local
library and check out a telecommunications theory book.

1. The raw transmission rate is 4800 baud. The program's interrupt
service routine simply keeps track of the time between transitions. If
you're receiving a perfect signal this will be some multiple of 1/4800
seconds which would then give you how many bits were high or low. Since
this is not the best of all possible worlds the program instead does the
following: transitions are used to synchronize a bit clock. One only
samples whenever this clock is in the middle of the bit to produce the

raw data stream. This greatly reduces jitter effects.

2. Whenever a tranmitter keys up the MDC4800 protocol calls for bit synchronization (a sequence of 1010101010101010....). In the program this will result in receive bit clock synchronization. There is no need to specifically look for the bit sync.

3. Look for frame synchronization in raw bit stream so that data frames can be broken apart. Frame synchronization consists of a 40 bit sequence : 0000011100001001001010100100010001101111. If this sequence is detected (or 35 out of 40 bits match up in the program) the system is idling and the next 112 bit data block is ignored by the program. If the inverted frame sync is detected one immediately knows that 112 bit data blocks will follow.

4. Receive the 112 bit data block and undo the bit interleave. This means that one must reorder the bits in the following sequence : {0,16, 32,48,64,80,96,1,17,33,49,65,81,97,2,18,34,...} if the orignal sequence were received as {0,1,2,3,4,5,6,7,8,...}.

5. Check the convolutional error correcting code and count the number of errors. The error correcting code is rate 1/2 which means we will be left with 56 data bytes. The encoder is constructed so that the output consists of the original data bits interspersed with error correcting code. The generating polynomial used is :
1 + X^-1 + X^-5 + X^-6
Whenever an error is detected a counter is incremented. An attempt is made to correct some errors by finding the syndrome and looking for the bogus bit.

6. Keep receiving 112 bit data blocks until either a new frame sync is found or two consecutive data blocks have an unacceptably large number of errors.

7. Each data block consists of six data bytes; the last 8 bits are status bits that are simply ignored. The program shows the data in two columns - hexadecimal and ASCII. This data is kept in a buffer and is written to the file "data.dat" when the program terminates.

8. What the program doesn't do: As a further check on the data there can be CRC checks. This varies from protocol to protocol so this program does not implement the CRC checks. Nonetheless, it is a relatively trivial matter to find the generating polynomial. The addresses, block counts, and message ID numbers are also quite easy to deduce.

As you can see, there is no encryption. The bit interleave and the error correcting coding are there solely to insure the integrity of the ASCII data. Since any moron could have figured this stuff out from scratch one could argue that MDTs do not use "...modulation parameters intentionally witheld from the public". Therefore the Electronic Communications Privacy Act may not prohibit receiving MDT tranmissions. However, consult your attorney to make sure.

The total disregard for security will no doubt annoy countless Motorola customers who were assured that their MDT systems were secure. Since Federal law states that NCIC information must be encrypted your local law enforcement agency might be forced to spend millions of dollars to upgrade to a secure MDT system - much to the delight of Motorola and its stockholders. Cynics might conclude that the release of a program like this is timed to coincide with the market saturation of existing MDT systems.

Also, this program is completely free and it had better stay that way. What's to prevent you from adapting this into a kit and selling it from classified ads in the back of Nuts and Volts? Nothing. But take a look at Motorola's patents sometime. You'll notice that this program does things that are covered by a shitload of patents. So any attempt to take financial advantage of this situtation will result in utter misery.

Please keep the following in mind: this program only works with the first serial port (COM1). If your mouse or modem is there too bad. If you don't like this rewrite the program.

What equipment do I need?

RADIO SCANNER:

A scanner that can receive 850-869 MHz. For those of you who don't know, this is the band where most business and public service trunked radio systems can be found along with the mobile data terminal transmissions. Chances are excellent that if your local authorities have a motorola trunked radio system and mobile data terminals that this is the frequency band in use. Very rarely will one find mobile data terminals in other frequency bands.

Now for the fun part - your scanner should probably be modified to allow you to tap off directly from the discriminator output. If you wait until the signal has gone through the radio's internal audio filtering the waveform will likely be too heavily distorted to be decoded. This is exactly the same problem that our friends who like to decode pager transmissions run into - some of them have claimed they can only decode 512 baud pager messages using the earphone output of their scanner. These mobile data terminal messages are 4800 baud so I don't think you have a snowball's chance in hell without using the discriminator output. If you don't know where to begin modifying your scanner you might want to ask those who monitor pagers how to get the discriminator output for your particular radio.

COMPUTER/SCANNER INTERFACE

Those of you who have already built your interface for decoding pager messages should be able to use that interface without any further ado. For those starting from scratch - you might want to check out packages intended for pager decoding such as PD203 and the interfaces they describe. The following excerpt gives an example of a decoder that should work just fine (lifted out of the PD203 POCSAG pager decoder

shareware documentation):

```
>
> 0.1 uF |\ +12v
> ---||----------------------|- \|
> AF IN | |741 \
> ---- | | /---------------------- Data Out
> | \ ------|+ /| | CTS (pin 5/8)
> | / 100K | |/-12v | or DSR (pin 6/6)
> | \ | |
> GND / ----/\/\/\---- GND ------ GND (pin 7/5)
> | | 100K
> | \ N.B. Pin Numbers for com port are
> GND / given as x/y, where x is for a 25
> \ 10K way, y for a 9 way.
> /
> |
> GND
>
```

This needs a mod - It is far to deaf as this. Remove the 10k resistor and replace it with a 470 ohm preset and 560 ohm fixed in series. Audio level is critical in the pd203 that he refers to ! - dg

> The above circuit is a Schmitt Trigger, having thresholds of about +/- 1v.

balls - its nearer to 3 to 4 volts p-p! (dg)

> If such a large threshold is not required, eg for a discriminator output,
> then the level of positive feedback may be reduced by either reducing the
> value of the 10K resistor or by increasing the value of the 100K feedback
> resistor.
>
> The +/- 12v for the op-amp can be derived from unused signals on the COM
> port (gives more like +/- 10v but works fine !):-
>

```
> TxD (2/3) --------------|<------------------------------------ -12v
> | |
> RTS (4/7) --------------|<-------- GND - -
> | | _ + 10uF
> --------->|------- - - |
> Diodes 1N4148 | - + 10uF GND
> | |
> DTR (20/4) ------------->|------------------------------------ +12v
>
```

If I were building this circuit I would strongly suggest tying the non-inverting (+) input of the op-amp to ground since you are working directly with the discriminator output and don't need a Schmitt trigger. All these parts or equivalents are easily available (even at your local Radio Shack which stocks the finest collection of components that have

failed the manufacturer's quality control checks and supported by a sales staff that's always got the wrong answers to your questions).

Also: DO NOT use the RI (ring indicator) as an input to the computer.

How do I check things?

As a first step, I would get a package such as PD203 and use it to decode a few pages. If you can get that working you know that that your interface circuit is functioning correctly.

If you are in a reasonably sized town you might be part of the ardis network. The ardis network is a nationwide commercial mobile data terminal network where one can send/receive E-mail messages from one's portable computer. It has been exclusively assigned the frequency of 855.8375 MHz. Therefore, if you can hear digital bursts on this frequency you are basically guarranteed that these are MDC4800 type messages. You should be able to get stuff popping up on your screen although a lot of the messages will not be plain english.

If your interface works but you can't seem to get any messages on the screen for a channel you know is a Motorola MDT system then it might be possible that your scanner/interface is putting out data with the polarity reversed. To check for this run the program with a command line arguement. When it runs you should an initial "Polarity reversed" message and hopefully then things will work out for you.

Other than that: if this program doesn't work pester someone else who has got it working. Don't bother pestering the author(s) of this posting; the shit(s) aka "she/he/it (s)" are afraid of a thousand lawyers from Motorola descending like fleas to infest their pubic hair and accordingly have decided to remain forever anonymous. No doubt someone on the usenet who sees this post will know what to do with this program and also hopefully rewrite into a more user friendly form. When you do please don't forget to release the source code.

Future projects/nightmares you might want to think about:

Certain MDT systems embed formatting information in the text in the form of ESC plus [plus a few more bytes. Someone might want to decode these on the fly and format the output so it looks exactly the same way as the user sees it.

Make it so that this program works with com ports other than COM1.

Make it user friendly?

Enlarge the data buffer from the current 30k.

Give the output data file an unique name each time the program is run instead of "data.dat".

How about sorting through the past traffic so that you only see traffic to a specified user?

The program does not cut data blocks off in the display but it might add an extra one or two (which will display as all zeroes). Someone might want to make all those zeroes be shown as blanks instead.

Write some real instructions.

Now the more ambitous stuff:

Are you half-way competent with RF engineering? Then listen in to the tranmissions from the mobile units back to the base station. That way you get everyone's password and user IDs as they log on to the MDT system. By this point you will no doubt have been able to figure out all of the appropriate communications protocols so you should think about getting your own transmitter up and running along with the necessary program modifications so that you can transmit MDT messages. The required transmitter can be very simple - for example, those masocists who want to start from scratch might want to special order an appropriate crystal (pulling the frequency with the computer's tranmit signal), building a frequency multiplier chain, and adding a one watt RF amplifier to top it all off (see the appropriate ARRL publications for more information on radio techniques). Now you can log in and look at the criminal records and motor vehicle information on anybody you can think of. Find out what your neigbors are hiding. Find out who that asshole was that cut you off downtown. Find out where your former girl/boy friend is trying to hide from you. And on and on...
Those with simpler tastes might want to simply transmit at the base station's frequency to any nearby MDT terminal - now you too can dispatch your local law enforcement agencies at the touch of your fingers!!! See your tax dollars at work tearing apart every seam of your neighbor's house. Or create strife and dissension in your local law enforcement agency as more and more officers come out of the closet using their MDTs trying to pick up fellow officers.

There are municipalities that have put GPS receivers on all of their vehicles. Should it happen that the information is sent back over one of these networks you could have your computer give you a real-time map showing the position of every vehicle and how far away they are from you.

Extend your knowledge to other data networks. Here you will want to look at the RAM mobile data network. It uses the MOBITEX protocol which is really easy to find information on. Since it is an 8 kilobaud GMSK signal there is a decent chance that you can use the interface described here. This transmission mode demmands much more from your equipment than MDT tranmissions. At the very least you must be much more careful to make sure you have adequate low frequency response. Despite this it is possible to receive and decode MOBITEX transmissions with a simple op-amp circuit! This just goes to show you what drivelling bullshit RAM's homepage is filled with - they explain in great detail how hackers will never be able to intercept user's radio tranmissions (incidentally

explaining how to decode their tranmissions). The necessary program will be the proverbial exercise left for the reader. For better performance buy a dedicated MOBITEX modem chip and hook it up to your computer.

A few words about the program:

Remember - you must have your decoder hooked up to COM1. The RTS line will be positive and the DTR line negative but if you built the decoder with a bridge rectifier you really don't have to worry about their polarity. Stop the program by punching any key; don't use control-c or control-break!

If you must reverse polarity run the program with any command line arguement (example: type in "mdt x" at the command line if your program is mdt.exe). You should then see the "Polarity Reversed." message pop up and hopefully things will then work.

As far as compiling this - save the latter portion of this posting (the program listing) and feed it to a C compiler. Pretty much any C compiler from Borland should work. If you (Heaven Forbid) use a Microsoft C compiler you might need to rename some calls such as outport. Follow any special instructions for programs using their own interrupt service routines. This program is not object oriented. It also does not want anything whatsoever to do with Windows. Please don't even think about running this program under Windows. Finally, here it is:

---------- C u t H e r e ! ! ! ----------

```
/* start of program listing */

#include <stdio.h>
#include <conio.h>
#include <dos.h>
#include <math.h>

/* Purpose of program: receive messages using the Motorola MDC4800 */
/* protocol and show them on the screen */
/* */
/* WARNING TO ALL : This program is free. Please distribute and modify*/
/* this program. I only request that you always include the source */
/* code so that others may also learn and add improvements. The */
/* status of this program at the time of the original release is : */
/* it doesn't have much in the way of a user interface or options but */
/* it should work if you follow the procedure in the text file. Don't */
/* expect any sort of support (you get what you pay for - nothing in */
/* this case). Finally, here's a special message to all of you who */
/* might have the urge to try to make money with this information: */
/* I know where you live. I will shave your pets and pour rubbing */
/* alcohol all over them (unless said pet happens to be a Rottweiler).*/
/* I will have sex with your wife while you off at work; on the rare */
/* occasions when you have sex with your wife she will in the throes */
```

```
/* of passion cry not your name but mine. I will sell drugs to the */
/* demented spawn you refer to as your children. And if that's not */
/* enough for you let a thousand lawyers from motorola descend on you */
/* and pound your fat rear end so far into the ground that it finally */
/* sees daylight again somewhere in Australia. */
/* */
/* */
/* General tidbits (a few of those "Why were things done this way */
/* questions). */
/* 1. Why is captured data kept in an array and only written to a */
/* disk file at the very end? Because disk access seems unreliable */
/* when so much time is taken up by the background interrupt service */
/* routine. */
/* 2. Why is the array storing this so small? Because yours truly was */
/* too damn lazy to use a pointer and allocate a huge chunk of memory.*/
/* (Hint for those of you who would like to improve this. */

Hello and thankyou for reading this ,what I am looking for is a list of the call sign and
area for patrols for the LAPD.I am curious what the different phonetic designators
mean.I have been listening to the LAPD on real audio site and it would be helpful to know what different units are transmitting.If you have a list could you please sent it to me . thank you in advance.

My bc200xlt has only an earphone plug, and I can't find an adaptor
this small to match it to a recorder. Does anyone have any ideas.

The cell phone transmitters and repeaters use frequencies differently.
Occasionally, only one conversation is put on a frequency. Another
frequency might have both conversations on it. I have programmed my
entire bc200xlt with two way conversations after sampling frequencies
that had two conversations before doing so. Later, that same
frequency can turn up being used for only one conversation. I have
concluded the frequencies do both single and dual conversations, and
you cannot predict when a given frequency will be used for which. If
someone has a better explanation than that, I would like to hear it.

: like a repeater output. I have all 14 FMRS frequencies programmed
: including the 467.6 which should be the input if this is indeed a
: repeater. Even with an outside antenna I can't hear the input. Since
: this is a FMRS frequency why can't I figure out the PL frequency and use
: this repeater myself??? Does anyone know who's repeater this is????
: Bo
: --

Well, repeaters are not authorized for the Family Radio Service.
Perhaps you are monitoring the General Mobile Radio Service (GMRS)
Dunno.... my frequency lists are lost again.

Repeaters typically require a fee.... don't stael airtime. There are many
pl tones... perhaps your radio doesn't have them all.

The discriminator output can be obtained by connecting a wire to TP2, which is on the top of the Linear PCB board(top of unit). There is what appears to be a resistor standing up with a small wire projecting upward. That is TP2. Connect a wire to that point, to a 47K resistor, then to the center conductor of a chassis mount RCA jack, or your choice. There is a free spot in the back of the unit to drill through, and mount the RCA jack.
As to other mods, Bill Cheek has two editions out of the "Scanner Modification Handbook, and then the "Ultimate Scanner". All three deal with the PRO-2006. I understand there is a company that sells all the parts for his mods. He also has designed a computer control board (I believe the CU-232) for the unit.

Optoelectronics has also produced a board for the unit to allow computer control.

I love the units, and have 2 PRO-2006's with the Opto OS456 boards installed.

Get Bill Cheek's books. I was very impressed with the mods available!

If you are an amateur radio operator, you could get the Yaesu FT-50R,
which scans for PL/DCS tones without a hitch! It is a dual band
handheld.

Yes!

Audio Implements
1703 Pearl Street
Waukesha, WI 53186
(414)524-2424

They have stock earpieces, and will give you a free kit to mold to your
ear as an impression, and they will give you a custom earpiece.

Bo Henderson <bo@physitron.com> wrote:
> ... monitoring the FMRS frequencies ... I hear activity on 462.6 ...

462.600 MHz is a GMRS repeater o/p freq, not an FRS channel.

From the FAF - Frequently Asked Frequencies
on CompuServe - Hamnet as FAF.TXT

FRS - Family Radio Service [95.627]

Ch Freq Ch Freq

1 462.5625 8 467.5625
2 462.5875 9 467.5875
3 462.6125 10 467.6125
4 462.6375 11 467.6375
5 462.6625 12 467.6625
6 462.6875 13 467.6875
7 462.7125 14 467.7125

The FRS was adopted on 10 May 96 and will be authorized
by July 96. It uses FM with a peak deviation of +/- 2.5 kHz.
Maximum power is 0.5w.
Channels 1 - 7 are shared with GMRS.

GMRS - General Mobile Radio Service [95.29]
[95.621]
Base/mobile repeater I/P

462.5500 467.5500
462.5625
462.5750 467.5750
462.5875
462.6000 467.6000
462.6125
462.6250 467.6250
462.6375
462.6500 467.6500
462.6625
462.6750 467.6750
462.6875
462.7000 467.7000
462.7125
462.7250 467.7250

In addition to the station's licensed channel, 462.675 may
be used for emergency and traveler's aid by all stations.

Interstitial channels (462.xxx5) may be used only in simplex mode with voice transmissions of no more than 5 watts. They are shared with the Family Radio Service.

Yaeh, but I think they called OJ. Does that mean the LAPD has a
right to violate the federal law and release the tapes to the public.
Actually, I have a feeling these tapes may have been made public
with the approval of a court, the civil court, as it came at the end
of the civil trial. If someone knows how these tapes became available
to the networks, I think we would all like to know. NBC had them
and ABC did as well. I think everyone got them.

The folks at Uniden told me the 900 phones they make are encrypted with an old military system that is no longer used in the military, but has been widely adapted by portable manufacturers. The signal does not stay on a single frequency, but moves, and is followed by the receiving end, which is programmed to track those same freqs. It is similar to the way a Russian satellite dish has to move in synchronicity with the satellite itself in order to capture the signal. There may be other 900 methods as well. I have seen references to them in these newsgroups.

Patrick, you're not getting it. This man can have all the security in the world on his own phone, but if he talks to a portable or cellular without such security, then he is on the air for any cheap scanner owner, anyway.

I didn't get it right away. A digital spred must be one of the 900
mhz portables used in homes and costing a good deal more than
46-49 mhz equipment. The radio station analogy is the correct one.
What does it matter what kind of security you have on YOUR phone (900
mhz),
when you are talking to one (46-49 mhz) that is on the air and
accessible with
a simple police scanner. I am waiting for the day, when someone
hooks a board, two simple CD players, and a microphone to his portable
and begins doing a radio show for the neighborhood. I have a friend
who calls me on his portable from Sacramento, while I am on a home
portable. We very often do a show that woud make any dj in the six to
ten a.m. slot sit up and take notice!

I have had to realign the VHF-low band synthesizer circuitry
in a few BC210s. The PLL wouldn't lock up fast enough on frequencies
near the band edges.

The VHF-low PLL won't even lock up in Manual mode if it is too
far out of alignment.

Sorry, I cannot furnish schematics, board diagrams, parts,
or detailed instructions.

Newell007 (newell007@aol.com) wrote:
: I am trying to pick up some industrial radios on my scanner. The units
: being used are Motorola HT600 radios with channels 1 thru 6. Are these
: radios ordered with specific frequencies for each channel or do they come
: with standard frequencies. If so, can anyone give me the HT600
: frequencies?

The HT600 is a synthesized radio for either VHF or UHF, so it could be any frequency. Look at the antenna, and if it is very thin or very short, the radio is probably UHF (450-470 MHz probably). It the antenna is longer and thick (6" or so, and 1/2" thick) the radio is VHF, probably 150+ MHz. If you know the company using them you may be able to look up the frequencies that they are assigned, but it could be almost anything....

Good luck!

Don't know if I am the "badly misinformed sales person" referred to here, but just in case, here goes.

I don't sell em, as I said, a friend owns a store that does, and I've spent a good deal of time there. What I actually do is engineering at a radio station, and we use a lot of nicads, and I have seen the memory effect there as well.

I've used the relay bulb setup discussed in other posts for a long time, and it works.

Out of all of the dead nicads I have seen virtually all of the ones that failed prematurely were charged improperly, so either this has an effect on the life of the battery, or it's one hell of a coincidence.

Jim Dean
>
> --
>
> Jim, ... Don't play fool to the folly of pedantic statements of "urban myth" or whatever. ALOT of people and organitions utilise the relay method, albeit a somewhat smarmy gold-plated putz a few messages ago said that it wasn't the bonafide way to discharge nicads (Mr Tesla he doth quote a Alexander Q-X-4910 Space Modulat-ah or whatever as being the legit way that anybody with PROFFESIONALISM WOULD use.) I have absolutly no time for that sort of intellectual arrogance and pseudo-MIT wannabee crap. Let's talk to the real "experts"......

. Ask the contractor's who drag their sorry ass each morning out of bed to actually work on site with 9.6 volt to 16 volt nicads to make their living on how they approach their cordless tools. Go a step further, ask Dewalt or Porter Cable or Makita engineers about the "memory syndrome" with the nicids pre-1988. They will state unequivocably and unabashedly about the problems with "memory" syndrome .They revamped many a product line to get around this then-inherent problem. Rest assured that they dedicated enuff R & D $$$$ on this to pay everybody's college tuition in the states. You will get instantaneous guffaws if you state that it is a "myth" from the "real experts"!! Post it to rec. woodworking and get the facts for yourself.

I don't know why I hoist the pottard for this topic anymore as there are bound to be some lack-wits trying to make chicken soup out of chicken feathers!!! Buy an alarm clark and wake up, Brian.....

(Getting off the soapbox)

Subject: FCC Imposed Charges... IMPORTANT - READ THIS

To my internet friends,

I am writing you this to inform you of a very important matter currently under review by the FCC. Your local telephone company has filed a proposal with the FCC to impose per minute charges for your internet service. They contend that your usage has, or will, hinder the operation of the telephone network.

It is my belief that internet usage will diminish if users were required to pay additional per minute charges. Since my New Vision business is done largely on the internet, and I'm sure some of yours are also, this could affect us greatly.

The FCC has created an email box for your comments, responses must be received by February 13, 1997. Send your comments to isp@fcc.gov and tell them what you think.

Please forward this email to all your friends on the internet so all voices may be heard.

Thanks for your time,

I have monitored my cities EDACS system for about a year. I have found that the radios key up in order of the suffixs.

.7375 will key up (856-860). then the .8375 will key up and then cycle down.

I am able to follow this GE system using my manual button

Hi Paul!

It is quite interesting to follow this tread ,this matter _will_ lead to some confusion : "How on earth could a tiny cellular or scanner bring 30.000.000 dollars worth of airplane down just like that ?"

You probably could use your scanner ,discman, _and_ cellular while air-borne ,odds would be far worse should this be more common practice.

To set the record straight, the Finnair crew managed to land the MD80 at Stockholm airport just a minute or so after the sudden roll-incident caused by the sudden disengagement of the autopilot.

European in-flight magazines refer to this story. Scandinavian Airlines "Scanorama" had its own feature on the incident this January.

If an airplane can maintain ground-pressure at 30.000+ feet; concealed in an aluminum tube,a cellular or other RF signal picks up and maintains a much greater strength because it doesn't spread ,doesn't die out like it does at groundlevel outside of the aircraft.

I don't think we should try to figure it out any other way, why risk it?

Maybe I'll ask some pilots comments on what their manuals state on this.

Best Regards,
Knut Otterbeck

>units?

All of what you ask for has already been done with the CE-232 interface.
The interface does intercept the data from the CPU to the LCD display
driver, which allows the controlling software to know exactly what is on
the scanner's display and to use that data accordingly. The CE-232 also
allows control of the scanner's keypad as well. However, this 2-way data
flow is only available on the PRO-2004/5/6 scanners since they have a
separate LCD controller. The newer scanners do not have a separate
LCD controller; making this data pick-off impossible.

Hello-

I haven't been doing scanning for long and was wondering
about what is the best all around scanner for the money- I came along when
the AOR 1000 (I have this one, still learning how to use it) and the AOR 1500
came out. I think the AOR 1000XLT is an okay unit, but I was wondering what
a good base/mobile unit like this would run. I know they made a AOR 3000 or
soemthing like that with an off the wall price, but I guess it had a lot of
filtering, computer interfaces, etc.... What about Yupiteru? I've seen these
as well but did not know how well they work. And as far as Radio shack/Bearcat
goes, I've had good luck with some of their products and bad with others. For
instance, the BC200XLT that I had always had some noise in the backround
no matter what the frequency was, or how strong the signal was. On the other
hand, I had a realistic PRO 2006, I believe (the 100 chan mobile) and have had
very good luck with this unit, aside from the birdies on 800 mhz. Any opinions
on a favorite scanner, antenna, or whatever, is appreciated.

-Mike

442. Asbury Park, NJ, and Monmouth County, NJ, freg's request...

Hello,
Can someone please send me a list or tell me where I can find all the freg's in the Asbury Park and Monmouth County areas of New Jersey? Also does anyone know any keyboard tricks or mods for a Radio Shack Pro-62? Does anyone know where I can get a freg converter for the 800-960 range? I know they aren't allowed to be manufactured anymore, and they are hard to find. Thank you for your help.

I am trying to scan the railroad frequencies around
160 mhz. I saw an ad for various Bearcat scanners
and wonder which would be most appropriate for
the 160 frequency. The scanners featured were the:

BC 120xlt at $149
BC 220xlt at $237
BC 760xlt at $237
BC 560xlt at $108

Aside from the price differences, what other significant
differences are there between these scanners, and which
would work best at 160mhz.

Thanks for any info,

Arnie

444. Motorola HT600 Frequencies

RELM Communications, Inc. recently released a new AM/FM scanner.
Hearing a few good things about it, I decided to order one and see
if it was worthy of adding to my collection.
What follows are my personal impressions regarding the features
and performance of this scanner. This, in no way, should be viewed
as an endorsement to purchase this radio. I have no personal or
business relations with RELM Communications, Inc.
These are simply thoughts offered to my fellow hobbyists who may
be interested in obtaining this particular radio.

What you get : HS200, antenna, belt-clip, AC charger, earphone,
carry strap and instruction manual

Basic specs :
Channels : 200
Banks : 10
Bands : 13
Coverage : 26-54, 118-174, 406-520, 806-960(minus cellular)
Scan : up to 100 channels/second
Search : 100 freqs/second
Steps : 5/12.5/25 kHz
Modes : FM & AM
Sensitivity : 0.5uv FM, 0.7uv AM
Conversion : Double
Delay : Fixed & programmable
Priority : 10 channels with heirarchy
S-meter : Yes

Lockout : Per channel
Lock : Keypad
Tone codes : CTCSS & DCS
Weather : Keypad
Light : Display and keypad
Earphone : Yes
Power : 4 AA batteries
Memory : Non-volatile

Construction and Physical
The radio case is molded in plastic with an attractive dark gray matte finish. I am very impressed with the overall fit and finish of this radio. All edges are well rounded giving it a "softer" appearance. Very solid and professional looking.
The front of the radio houses the display(top), keypad(middle) and speaker grill(bottom). The keys are white with black lettering, except for the ENTER key which is orange, while text above certain keys is light blue. Two of the keys, located in the bottom row, are are the exception and are black and elliptical-shaped.
The top panel consists of BNC antenna jack, power/volume, squelch and rotary control. The power/volume control sits atop the squelch control. The big complaint here is that neither one of these controls are marked to indicate their position. This leads you to constantly check the volume and squelch settings. It is strange these have no markings when there are a series of 11 dots printed around the circumference of the squelch control!
The antenna that connects to the BNC jack is very reminiscent of the Pro-34 antenna. Holding them side by side I could not tell any real difference. This antenna is a jacketed coil giving it a "ribbed" apperance that tapers slightly at the end which is covered by a plastic cap. Compared to the typical Radio Shack/Uniden antennas, it is nearly two inches longer and quite pliable. If it behaves like the Pro-34 antenna, you will find it eventually takes on a crooked shape of its own!
The right panel contains the post for the hand-strap, the earphone jack and AC adapter connection. At the bottom of the left panel is the door for the battery "catridge". This is probably the flimsiest design of the radio that I have noted. You access the batter compart-ment by sliding this door down and then swinging it up. You will probably find that when the door is swung up, it has a tendency to detach from the radio. Once the door is open, the radio can be tipped to help the battery cartridge to slide out. This cartridge holds 4 AA cells of your choosing.
The back panel contains the mounting holes for the belt-clip and the manufacturor sticker containing the serial number. The supplied belt clip is all metal and VERY sturdy. Nice job!
This radio is very similar in width and depth when compared to most of today's popular hand-helds. It is almost identical to the AR-8000 and MVT-7100, taller than the Pro-43/51/60 and BC 150/220/230 but shorter than the BC3000(excluding height with antenna).

Features
The display is very much like that of the Yupiteru MVT-7100. It is quite large and very readable from almost any angle. The main digits are just slightly smaller than those of the BC150/220/230. The display itself consists of the following indicators : channel number/tone code, bank number, weather scan, tone, FM/AM, Scan/ Search, frequency, S-meter, keylock, priority, hold, delay, lock-out and low battery.
The S-meter consists of a BUSY indicator and five-segments.
This unit has outstanding audio power and clarity. Power is rated at 300mW with batteries and 450mW with the AC adapter. The extra power with the adapter is not really usable since any setting above 75% or so creates too much distortion and case vibration. The usable power is slightly more than the BC230 but less than the MVT-7100. And the clarity is excellent; right on par with the 7100 which I consider to deliver the best sound in today's crop of handheld receivers.
The backlight for this unit illuminates the display and the keypad(very nice!) just like the MVT-7100 and AR-8000. The light is green and very adequate. Pressing the lamp key results in a three second illmuination. Any key pressed while the light is on resets the three second timer ensuring you have illumination while you are keying.
This radio runs on 4 AA cells and seems to do quite nicely for power management. I installed 4 AA alkalines immediately and have yet to replace them so I can give no usage times. I will say it has been used under "normal" conditions for the last six days and is probably pushing 9 hours. I have done lots of scanning and searching, since I brought it along on my holiday travels up north, as well as loud audio levels while waiting in airport terminals listening to ground crews, security and traffic controllers.
The manual lists the following power ratings when monitoring a single channel : 65mA(normal), 38mA(battery saver) and 170mA (max audio).
This radio does come with an AC adapter that supplies 12 volts at 200mA. However, this adapter is only designed to power the unit when it is using ni-cads or with the batteries removed. Beware those of you who like to use alkalines for portable use and then plug it into the AC when at home! Just say no!
One excellent feature of this radio is its ability to remember what it was doing when it was switched off like the AR-8000 and SC150. If you are scanning, searching or monitoring a single channel when you switch the unit off, it will return to this mode the next time you turn it back on! I find this particular feature very user-friendly and wish all radios did this(are you listening Uniden and Radio Shack?)

Programming
When programming the HS200, I discovered some good things and some bad things. To program a frequency, you have to enter the

frequency, press ENT, enter a channel number and press ENT. If you wish to enter a tone code for this channel, you must press ENT, enter the code and press ENT again. Having to enter the channel number is a pain and is probably how RELM got around some of the pesky Uniden patented features.
I guess I've gotten too use to the Radio Shack/Uniden types where you can select and see the channel and bank number, then program the frequency. RELM does not display the bank number associated with a particular channel number like the RS and Uniden units do. You must use the channel numbers imprinted above the numeric keys to figure out what channel is where. The job is made even more difficult by the fact that you can't view empty channels.
To go to an existing channel, you can type in the channel number and press ENT, use the MAN key to step through them sequentially or use the rotary control on the top panel. Any channel which is empty will be skipped. If you wish to delete a channel(i.e. make it empty), you must press CLR and ENT to erase it. Empty channels are not scanned.
While you are examining the contents of a particular channel, you are said to be in manual mode. If you remain on a particular channel for more than approximately three seconds with no signal received, the radio goes into battery saver mode. This allows power requirements to drop to 38mA.
While programming frequencies, if the frequency contains three significant digits(those above the decimal point), you don't have to enter the '.' character. Additionally, when programming frequencies which are in a 12.5kHz range, this radio will automatically fill in the last two digits(e.g. when entering 855.9875, as soon as you enter the second '8', the scanner is smart enough to put in the '75'). With all the extra typing you have to do to enter the channel number, I found these two features quite helpful and time saving.

Scan
Once you've programmed up your channels, it's time to scan. Pressing the SCN buttons starts the scanning process. All banks being scanned are displayed at the top of the display the same as most RS and Uniden radios. The scan indicator is dis-played and the frequency readout displays the word SCAN.
Like RS and Uniden radios, press the respective bank number key to toggle scanning for that particular bank on and off.
When scanning stops, SCAN is replaced with the frequency and the respective channel number is displayed. One peculiarity is the fact that the bank indicators do not change when scanning stops on an active signal. Most radios will somehow indicate the bank to which the displayed channel belongs; the HS200 does not. I found this irritating when used on banks of frequencies I was not familiar with. When scanning stopped, I did not immediately know whether I was listening to a state, county or local police

frequency. I had to look at the channel number, then figure out which bank it belonged to so that I could relate it to the state police bank, county sheriff bank or local police bank. Under normal conditions, after a signal is received and the transmission ends, there is a 1/2 second delay before scanning resumes. This is not that intrusive but I do wonder how they arrived at this delay amount. If you want, you can toggle the delay mode on and the delay becomes 2 seconds. There is not a per channel delay feature, only a global scan delay.
This radio also contains a weather frequency scanning key which scans a list of pre-programmed NOAA weather frequencies which includes one Canadian frequency.
While scanning, it is possible to enable priority channel sampling. See the Priority section for further details.

Search
The HS200 comes with one pair of search limits allowing you to program your own frequency range search. After entering a low and high frequency limit, the SRCH key is pressed to begin the hunt.
While searching, you are in either delay or hold mode. In delay mode, after a signal is received, searching will resume two seconds after the transmission ends or the SRCH key is pressed or the rotary control is turned while still receiving the signal. In hold mode, after a signal is received, searching will not resume unless the SRCH key is pressed or the mode is toggled to delay.
When stopped on a frequency, pressing ENT allows you to store this frequency in a channel. If, after pressing the ENT key, a channel is displayed, this indicates this frequency has already been programmed into that channel. Otherwise, you can enter the desired the channel number to store the frequency to.
The biggest drawback with the HS200 search mode is the inability to switch search directions while searching. It is onlt possible to switch directions while receiving a signal in delay mode. This, to me, is too restrictive a condition. And this is not what I would expect of a scanner which has a rotary control. But, if you try and use the rotary control while the scanner is searching, it simply returns to manual mode.
When the search has stopped on an active transmission, and you are in hold mode, the rotary control may be used to increase or decrease the displayed frequency by the current step size. This is very handy and what I would expect of a rotary control.
Another useful feature of this scanner is the ability to lock out 100 frequencies from being searched. While searching, if you come across a birdie, empty carrier or any other undesired frequency, simply press the LOCK key and this

frequency will be placed in the pass list and will not be stopped on again. If you manage to fill up all 100 frequencies and try to lock out number 101, the scanner will display FULL and not accept the frequency. I find this more useful than some scanners which simply start at the head of the list and begin to overwrite previous pass frequencies unknown to you, the user.
The 100 frequency pass list is cleared whenver a new low or high search limit is entered. For the most part, I find this "automatic" clearing more useful than most of the other radios I have where you manually have to erase the list. Granted, this method is not as flexible, but for me I find it quite useful.
While scanning, it is possible to enable priority channel sampling. See the Priority section for further details.

Priority
The HS200 contains ten priority channels. The first channel of each bank is designated as the priority channel for that bank. I find this scheme of fixed priority channels to be a bit inflexible in today's age of digital programmability.
By pressing the PRI key, whether in manual, scan, weather scan or search mode, the PRI indicator is displayed and priority channels are sampled every two seconds.
When in manual, search or weather scan mode, if priority mode is enabled, only channel 1 will be sampled.
When in scan mode with priority mode enabled, only those priority channels of the banks being scanned will be sampled. Furthermore, these priority channels will not be sampled if they have been locked out.
The one caveat to these rules during scan mode is for channel 1. It has the highest priority; it will always be sampled regardless of the bank being scanned and even if it is locked out. If the current scanning state dictates that more than one priority channel is being sampled, channel 1 has priority over all the other priority channels.
For example, if you are scanning banks 1 and 7, this would indicate channels 1 and 121 are being priority sampled(assuming 121 is not locked out). If, while scanning, channel 121 becomes active, scanning will stop and 121 will be monitored until it is no longer active. While 121 is being monitored, channel 1 continues to be sampled every two seconds. Should channel 1 become active, it will be monitored until it is no longer active.
For purposes that are unknown, if prioirty mode is enabled while scanning, the large SCAN in the frequency display changes to PSCAN.

Tone Codes
The HS200 comes equipped to decode CTCSS and DCS codes. Using a code look-up table contained in the instruction manual, you can dictate a CTCSS/DCS code to associate with any channel. Once

a channel has a code associated with it, the squelch will only be opened for a transmission that has a matching CTCSS/DCS code. If an active transmission is received which does not have the proper CTCSS/DCS code, the BUSY indicator will be displayed along with the appropriate S-meter reading, but the squelch will remain closed and thus, no audio will be heard.
By default, all programmed channels have a code of 0 which means they have no associated CTCSS/DCS code and the squelch will always be opened for any active transmission. Programming of the tone code is very easy and is decsribed in the above section on programming.
To review the tone code for a particular channel, simply enter manual mode and view the desired channel. Press ENT and the channel number and frequency will be replaced by the tone code and its respective value.
Tone decoding is only available during manaul or scan mode. The decoding can be toggled on and off using a dedicated key. When decoding is enabled, the TN indicator will be displayed. The instruction manual contains a chart which maps the code numbers the HS200 uses onto the CTCSS and DCS tones. If you do not have the chart available when programming the codes, you will have to use the rotary control to cycle through a list of all supported tones to find the one you are looking for.

RF performance
The HS200 has proven to be a great performer! I did some comparisons in the field against the BC3000 to see how it would hold up against the latest handheld from Uniden.
The HS200 proved to be a lot more sensitive in the VHF low band(30-50MHz) and more sensitive in the VHF high band(148-174 MHz). The BC3000 was a bit more sensitive in the UHF standard band(450-470MHz) but the HS200 seemed to have better quieting when receiving transmissions.
Being a pilot, one of my pet peeves is comparisons of how well a radio works on the VHF AM aircraft frequencies. I have never been impressed by any of the Uniden products when it comes to this category. The Radio Shack products made by GRE do MUCH better. And the Yupiteru is once again king of the hill, in my humble opinion. The HS200 is a little more sensitive than the GRE radios, but the audio clarity and quieting is not as good. It is still a great AM performer and stands several notches above any of the Unidens.
As for intermodulation, the HS200 had a little more in the 460MHz business bands but less intermod in the 160MHz frequencies. Both radios appeared equally sensitive in the 800MHz frequencies but the HS200 was, of course, more prone to intermod due to its double conversion circuitry.
The HS200 also appeared to have less interference from paging and cellular signals than either the BC230 or the Pro-51. And if you are able to use the CTCSS/DCS decoding, I don't think

you'll have to worry about this at all!
Scanning the receiver's full frequency range revealed 26
birdies and very few cellular phone frequency images.

Overall
The main competition for the HS200 will be the SC150 and BC230XLT
which typically retail between $150 and $240. I've seen prices for
the HS200 between $240 and $280. So if you end up buying the HS200,
you'll be spending more money. But will you be getting a better
radio? I think so.
This radio is an excellent RF performer and is loaded with lots
of features when you consider its price. It also has great audio
power and clarity. Add in the rotary control, CTCSS/DCS decoding,
S-meter, 100 pass frequencies, power-on resume capability and you
have one heck of a radio for $250.
If and when they come out with the HS300, I would personally
like to see triple conversion, markings on the power/volume and
squelch controls, a VFO for use with the rotary control, and
reversible scan and search directions. For this last request,
RELM would have to take out the "feature" where in scan or search
mode, if the rotary control is turned, the radio is put into
manual mode. Trust me, I would not miss this "feature" one bit!
And we could debate adding a per channel attenuator and delay
functionality. With CTCSS/DCS decoding, do we need an attenuator?
And I don't use delay too much when scanning. The only time I
really use it is during search mode and this radio gives me
just that.
All I can say is nice going RELM! You've put out one heck of
a great radio that looks good and works great! I look forward to
your next offering!

They only cost about $8 to $12 dollars, and you can order one from:

1-800-THE-SHACK

They are reasonably prompt and their manuals are reasonably priced for
the most part.

When this happens here in Houston, it's the helicopter talking to the ground units on a simplex channel (ch 8). Since the helicopter is so high up and clear of obstructions we can hear it from far away, several times further away than we can hear ourselves. Sounds like the helicopter is in range of whatever antenna they are using to feed RealAudio, but the ground units are not.

radio shack 2026....

radio Shack makes another one...with a name : Patrolman ... good
set.

I have all three above in my Jeep and they work flawlessly.....

bill conduit
etc.

don't forget the Radio Shack mobile radio: 50 channels...they are
selling them out at 100 bucks... smaller than the above's....

definitely for mounting where only your dog sniffs....
put on inner roof .... run wires underneath the fabric and fits
nice...basic scanner at a great price....stores have one or two.

usually demo models....

> my scanner. Are scanners legal/legit in England? What about ones that
> get 800 freqs? Is there a good site that might list London frequencies
> for law enforcement, fire, media, etc?

First off....feel free to bring your scanner. There are no legislations regarding the ownership of scanning receivers in the UK. Neither are the any legistlations regarding the frequency coverage of scanners.

"800" freq's are not used in the same way here in the UK as they are in the States. There are no trunked systems as you are perhaps familiar and analogue cellular system operates on different frequencies.

For some interesting suggestions as to where to look for frequencies try Paul Jones web site at www.termcon.demon.co.uk - there are several good lists on there that will point you in the right direction.

The publication "The UK Scanning Doirectory" is what you could call the equivalent to Police Call or similar although much of the information (and more) will be found on the above web site.

However......

Now you have your frequencies.....you are (for the sake of argument) not allowed to listen to any ! As a member of the public you are only entitled to listen to AM/FM Broadcast transmissions, Amateur and CB transmissions and when at sea Marine weather broadcasts....anything else: Airband, Emergency services, Cellular, Cordless etc is technically illegal.

For the official Government view on scanners visit the Radio Communications web site at www.open.gov.uk/radiocom/rahome.htm

Fear not though....the official legislation would seem to be very much in contradiction with itself when you see the number of scanners available in the UK and the number in use at some places/events such as the car parks and viewing locations at airports and airfields.

Bring your scanner but be less "open" with it than you might be back home. If you are going to use it out and about use an earpiece - there will be lots to listen to.

Have a good trip.

>> some confusion : "How on earth could a tiny cellular or scanner bring
>> 30.000.000 dollars worth of airplane down just like that ?"
>>
All

I seem to be misquoted here, the point I was trying to make is that
cellular telephones are NOT cheap bits of electronic tat . Not that they
wouldn't affect sensitive electronic equipment.

I have been involved in EMC testing of systems, and the new GSM phones
are quite good at setting off any analogue sensors when used in close
proximity. I personaly would not:-

A- Use a Cellphone in an airplane
B- Recomend anyone else does
C- Get in an airplane at all (scared to death!)

However, as electonic equipment will become more EMC tolerant as years
go by, the danger ?should? reduce.

As for the leakage of local oscilators in cheap scanners, well thats
another story. The screening of such devices is usualy a bit of
semiconductive paint on the inside of the cabinet / housing. The VCO is
usualy in a screened enclosure but the leakage can be quite high.

Its affect on ILS etc may be only slight but it would be variable, and
therfore is very difficult to accomadate.

Regards

If a person intercepts a phone call regarding illegal activity (i.e. drug dealing, prostitution, etc) and calls the police with that information, can the police act on it, regardless of how the information was gathered? It seems like it would be ok. couldn't the police simply treat it as an anonymous tip? Just curious, because I hear so much of this kind of thing on my scanner.

This could be particularly amusing if the person doing the ordering
was...say, of African-American descent and the prankster were to say the
reason they were not delivering was due to that fact. Can you imagine the
"heated response" the pizza place would then get from the customer when
they called back :-)

We found that we use the monitor anytime the baby's sleeping and we
aren't. Even if you're co-sleeping, odds are that there will be times
when the baby's asleep and you don't necessarily want to be in the same
room.

I de-recommend the Gerry monitor; it went bad on us after less than a
year; developed an intractable buzz that my techie husband says is due to
a faulty capacitor, whatever that is.

We're now using one from Sony that a friend gave us after using it with
her two kids, and it seems to be working just dandy, but I don't see them
in stores. Some other friends of ours like their Fisher-Price Sound and
Lights model.

Tauzin: Toughen Eavesdropping Law

By JEANNINE AVERSA
Associated Press Writer
WASHINGTON (AP) -- All it took was a minute, a two-inch piece of wire and a soldering gun for Rep. Billy Tauzin to convert a legal radio scanner into one that picks up cellular phone calls.
Most experts agree it's illegal to do this but enforcement is difficult.
Tauzin, R-La., chairman of the House Commerce Committee's telecommunications subcommittee, who rigged the scanner at a hearing Wednesday, is considering legislation to toughen laws against altering listening equipment.
Cellular telephone intercepts by scanner caught the public eye after a Florida couple using a police scanner taped a conference call among Republican leaders, one on a cell phone, discussing House Speaker Newt Gingrich's ethics case. Parts of the tape were subsequently printed in The New York Times.
Of 10 million legal scanners sold in the United States, it's estimated that a ``few hundred thousand'' have been modified to pick up cellular frequencies, testified Bob Grove, whose North Carolina company offers such alteration services. New digital cellular technology is supposed to make such eavesdropping more difficult.
Tauzin used the off-the-shelf police scanner he altered to pick up a conversation between willing participants, Rep. Edward Markey, D-Mass., on a cellular phone and Rep. Anna Eshoo, D-Calif., on a regular phone.
Grove insists he operates within the bounds of the law. Markey, who wrote a 1992 law designed to protect cellular callers' privacy, disagreed.
``It's illegal to modify,'' Markey declared, vowing to rewrite the law to clearly block the sale of modified devices.
Markey's law, which took effect in 1994, made illegal the import, manufacture and sale in the United States of scanners that work on cellular frequencies. It also required that new scanners cannot be ``readily altered'' to pick up cellular calls.
Information to turn police scanners into cellular scanners is available on the Internet and in some magazines, Tauzin said.
``The law and its enforcement have been inadequate,'' testified Thomas Wheeler, president of the Cellular Telecommunications Industry Association, representing cellular companies.
Wheeler, who helped Tauzin demonstrate how easily legal scanners

can be modified, asked for tougher laws to cover new technologies.
``It is time for the electronic stalkers ... to stop thumbing their nose at the Congress and trampling on individuals' rights,'' he said.
``There are laws on the books protecting the privacy of these calls,'' Tauzin said, ``but apparently they may not be working the way Congress intended,''
In an interview with The Associated Press, Grove said his company, Grove Enterprises Inc., operates legally because it neither sells nor markets altered scanners.
``There is no caveat, no direct prohibition against modifying those scanners,'' Grove said.
While those precise words are not used in the law or regulations, communications attorneys say companies or individuals that modify scanners to pick up cellular signals are violating federal provisions.
In general, it violates federal law to intercept a cellular telephone conversation and pass on the contents to another party. The exceptions: when police obtain court orders to use wiretaps in monitoring suspected criminals and when one party to a conversation has given permission. Many states don't allow eavesdropping based on such consent agreements.

WinTone 1.51 Real-Time DTMF decoder/Scanner monitor for Win95/NT is now available, and it runs 50% faster than before - Making it run great on most 486 machines! Here are some of the features that are available :

* Real-Time DTMF decoding via your Sound Card
* Extensive Tone Logging/Transformation
* Decoding DTMF tones from WAV files
* Squelch controlled Scanner monitoring to a WAV file
* DTMF Triggers - Launch an event when DTMF tones are heard
* On-The-Fly Save to a WAV file while you are decoding
* Tunable options to fit tyour listening environment
* NOW 50% FASTER - WILL RUN ON MOST 486 MACHINES!!!!

Come take a look for yourself - You wont regret it!

First of all, it was a one time thing. I am sorry for making light of it. I can see all of your points (the negative ones) and they're valid. I never really considered the overall implications of my prank. I am not condoning malicious activity and I certainly never meant any harm to the pizza guy. It was an impulsive act. It was funny as hell, but nonetheless irresponsible.

>
I asked the guys at Javiation the same question and here's what they said:

To restore full coverage to the PRO-26 (so you have "normal" keypad entry
of all frequencies 25-1300MHz) you need to replace the IC
fitted to your model with the IC fitted to the European model. This allows
full coverage - all other features are identical although some default step
siuzes differ but as you can select any step size on any frequency this
doesn't really matter.

The CPU alone is 39.00 Pounds - about US$50 or $60 at the moment. The CPU is a
100 pin (4 x 25) Surface Mount soldered CPU. I would strongly suggest that
experience in this type of work is needed together with the correct tools.

If you want to take a look at the CPU to "assess" the situation it is pretty
easy to get to. Remove the the two visible screws on the back and two in the
battery compartment to the allow the plastic back to be taken off. The RF
Board will also then lift away from the logic board.

The logic board has a metal RF shield over most of it retailed by several
screws. Remove the scres and you can gently lift the shield up. It wil not
come away as it is soldered at the top two corners. The CPU is in the
centre of this board and labled Uniden UC1702.

This is the CPU you need to remove and replace. Replacing with the UC1771
CPU will give full 25-1300MHz coverage.

The complete logic boards were 89.00 Pounds - about US$140 or so. The logic
board
is considerable easier to replace and has all the components including the CPU
already fitted. Just a small number of screws need to be removed to replace
the
logic board.

Both prices include delivery by Air Mail.

We do not have the CPU in stock at the moment but do have a small number of
logic boards in stock. Two varients of the logic board exist - some very
early with the female socket at the lower right hand corner whilst later and
most models have the pins on the logic board and the socket on the RF Board.

486. Sportcat/House Subcommitee Investigation??

Newsgroup: rec.radio.scanner
Date: 1997-02-05 00:00:00 UTC
From: rbrowne@erols.com
Message-ID: <5db6m3$6t6@boursy.news.erols.com>
Source record: 208798

In todays local news (Washington, DC) they did a brief story on the Senate (or house) subcomittee on cellular phone privacy. Part of the piece focused on modifying scanners to receive the cellular frequency. I am almost positive that the model that showed was a Bearcat Sportcat 150, (They only showed the back cover and the inside circuit board) They claimed that "all you have to do is solder two wires together to get cellular frequencies") I thought this was not possible for Sportcats? Is this true? By the way, none of these news programs have yet to mention that Sportcats and other scanners can get cellular frequencies anyway via cellul;ar imaging,

From someone who had a baby that required constant
monitoring thanks to the damn pertussis shot that ended
up killing her - three ways to go:
1) get a security camera setup through your local
warehouse club - $300
2) Fisher-price, with extra recievers being garage sale
scanners.
3) Get a(n) FM transmitter - something thke the Ramsey FM-10
where you can use a standard walkman - just make sure that the
transmitter has a decent antenna.

The above did a decent job for us - the FM transmitter worked
for a couple of acres when I was cutting the grass, the Fisher-price
montior/scanner combo had better fidelity throughout the house, and
the CCD camera worked well at night.

I caught my neighbors making up serious lies on several occasions about me to others via cordless and it never bothered me because we didn't know each other. Last year they were going through a nasty divorce and I knew they were moving out, so I helped things go a little faster for them.
When he was home and his wife was gone, I would call and ask for his wife and act like I wasn't sure if I had the right number. When she was home and he was gone, my wife would call and ask for him. They both always called thier mothers after each call.
Ahhhh... had to tell somebody this.

We have a Casio that works well for us. It only has two channels (I don't know if others have more) but that isn't a problem in my small town. I like that there are lights that flash in addition to the audio part, because sometimes you're vacuuming or whatever and may not hear the sound, but will see the lights.

Wether your a ham or just a scanner monitor, if your in the NYC-Long Island Metro area be sure to check out the MLIS (Monitoring Long Island Sounds) Scanner Net every Tuesday night from 8-10PM on 146.805. If your a ham check in, if not... net control gives out his address every week so non-hams can mail in their scanner info or questions. The net is supplemented by a free monthly 6 page newletter and we also hold a monthly meeting, usually at a Nathan's Resturant somewhere on Long Island the 3rd Thursday of the month.

Check in for more details.

I picked up a Uniden MR-8100 for a great price (free), and have been working with it. The wiring harness was cut off close to the radio, but I had managed to figure out red and black (+/- 12v, not too tough), also gray and white (speaker). It's been working fine, but now I'm consumed with curiousity: what's the green wire for?

Without giving color coding (of course), the manual shows 2 wires to the power connector (red and black) and 3 to the speaker connector (gray, white and green). Any ideas?

I heartily recommend the Fisher-Price basic model (got mine for a shower gift so I don't know the cost). It's ultra sensitive and pretty inexpensive. You can hear the neighbor's dog barking through a closed window 500 yards away with the dishwasher running... you get the picture.

Yeah.. that's true, but there's no diffrence. Both of them are meant to
hurt/kill... but then again I guess a child can't really get his/her
hands on a "Lazer" gun... hmmm.

But still... they punch and kick and smash and stuff.

I forget where I found the following - have fun!

Frequencies in the "dot" or "star" radios from
several manufacturers are identified by a
color sticker usually located on the bottom
of the radio.

BLUE DOT 154.570 MHZ
RED DOT 151.625 MHZ
GREEN DOT 154.600 MHZ
PURPLE DOT 151.955 MHZ
BROWN DOT 464.500 MHZ
YELLOW DOT 464.550 MHZ
J-DOT 467.7625 MHZ (a white dot with a "J" centered on it)
K-DOT 467.8125 MHZ (same but "K")
SILVER DOT 467.8500 MHZ
GOLD STAR 467.8750 MHZ
RED START 467.9000 MHZ
BLUE STAR 467.9250 MHZ

Hi,

If anyone has any mods\info\tricks\opinions\ideas about the BC-100 scanner
(not the 100XLT) please tell me. This is a 16 Channel scanner with
general VHF and UHF covedge.

Thanks.
Eugene. 73zzzzzzzzzzzzzzzzzzz

Do a search for a web site called radiophone it will have a file
called the Motorola Bible which has all of the cell freqs. The mobile
units are in the 824-848 mhz range and the towers are in the 869-894
mhz range. Your scanner may or may not get these ranges but if it has
what is called "Duel Conversion" you can recieve what are called
"image" freqencies of cell conversions in the 897-918 mhz band. If
you get the Motorola Bible try adding 21.5925 mhz to the freqs listed
in the forward control freqs (the cell towers).

I am wanting to buy a new scanner. I would like to be able to control it by computer if I want and would like to have continuous coverage of the 25-1.3 ghz range. What would be a good economical unit. I would prefer handheld but would settle for a base/moble unit. Will I have to go to Canada to buy it?

Here in Texas we have "TLETS", Texas Law Enforcement Telecommunications System. It is the system whereby the various agencies communicate with each other, and also access state and federal databases for criminal histroy checks. When TLETS is down, we can't check driver's licenses, vehicle registrations, or criminal histories or warrants. Sounds like what you heard was "MLETS" is down. TLETS goes down for maintenance on Sunday nights, and usually any time we get a good rain.

>
> Could your PTT be locked? check your settings.

NOPE....not locked......I was on the phone with yaesu for about 30mins
today trying to figure it out......I mailed it in to them to repair..
Didnt tell them the cell mod was done, just that I got it for a christ-
mas present and it suddenly stopped transmitting........If they can
get it back to normal I'll leave well enough alone!! :) Like I said
the mod worked perfectly but I must have either accidently powered it
on the incorrect way or something..... normally when you change settings
via the knob and go to the menu.. you normally would push the ptt to
save & confirm the setting, well it wouldnt even do that.. The ptt
didnt work at all........We'll see....Like I said I fedexed it today..
hopefully I'll have it back in a few weeks in working order!!!

Thanks for the post..

MARK

>
>>>I am trying to scan the railroad frequencies around
>>>160 mhz...which would be most appropriate for the 160
>>>frequency...
>
I was asking myself the same question last July, here's my tale:

I started into scanning by listening in on railroads up here in Canada with a Bearcat 210 back in the early 70s. It is a dual conversion unit and is still working. Only problem with it at that time was a "birdie frequency" at 161.200 Mhz which was a real pain because Canadian National has a dispatcher frequency at 161.205. Fortunately, the Canadian Rep. was able to retune the scanner to work around this problem.

Back then it wasn't too bad using a dual conversion scanner. I lived in a medium sized city of 60,000 and pagers were in their infancy while cordless and cellular phones didn't exist. There wasn't much activity on the radio waves by todays standards.

Now it's the 90s and there are too many radio transmissions out there for a dual conversion scanner. Triple conversion is the way to go.

Since I wanted to monitor more than railroad (although I have 39 RR freqs. in my current scanner), I did plenty of investigation before I bought my current scanner - after all it is a significant investment and who needs the hassle of a product that doesn't live up to its "advertised "claims. I even bought the equivalent of the Bearcat BC890 dual conversion unit with a 30 day satisfaction gaurantee at my local Radio Shack. I returned this scanner after 2 days because it could not handle a base antenna - too much image frequency junk came out of it due to its dual conversion construction.

After reading and putting up postings on the scanner newsgroups and reviewing articles in Groves "Monitoring Times" I bought a Bearcat BC9000-XLT base unit with a CTCSS tone board. It is an amazing scanner for the price. The more expensive brands were out of reach financially ie. AOR. I ordered it through a US vendor and saved myself approx. $300 CDN vs. buying it locally in the Toronto, Ontario area.

This 500 channel scanner gives "full range frequency coverage" for my purposes and the tone board is invaluable. I monitor Fire, Police,

Ambulance, Railroad, Air Emergency, Cordless Phones (sometimes only - just for fun!), Media and Weather. Each category has a bank(s) assigned to it that I can lock out if I wish. You can also assign alpha-numeric labels to each channel that appear on the backlit display when that channel is active, so insted of displaying 161.415 Mhz. it shows "CN Ch.1 Road". Makes it really easy to see who is talking.

This scanner has cellular blocked, but a recent newsgroup posting gave the cellular image frequency ranges for this scanner and there is plenty of cellular activity.

So there you have it. Whether you are looking for a base or mobile scanner, if you can afford it, go for the triple conversion unit.

Did I mention the new trunking scanners?.............

A Steam Locomotive is a Beautiful Thing!

> of "I saw him go north", "I saw him go south", "No..he went east..it was

Well here's the situation Dux. I am not deaf to the needs of some
control over how proactive broadcasting is implemented. In fact if
you look at my posts on this matter you will see that I'm really arguing
for two eras: an era where OPEN broadcasting is an ideal solution
because it is inexpensive and is passive on the part of police agencies
and the public because all anyone needs is a cheap police scanner to
take advantage of it. But I'm also arguing for an era of PROACTIVE
broadcasts with the public when voice communications is reduced to a
trickle or is completely digitized. Open broadcasting has the potential
to wreak as much havoc as you point out. As you also point out,
however, only a minority of people have police scanners so that this
ungodly chaos of crowd control you worry about rarely transpires. After
all, did the OJ crowd swell because of police scanners or the media?
And if it was the media, do you suggest we restrict what the media can
report? Probably not.

In an era of proactive police communication with the public, the
potential chaos of a scanner-toting crowd will eventually give way to
reluctantly less-spontaneous solutions that will, in all irony, render
the police themselves as a kind of "rapid media" distributor. They
won't compete with the critical media because the objectives will be to
increase immediate public safety and clear crime - professional
crimefighting tactics that have nothing to do with informing for
informing's sake. Yes, police will win the control issue, and I've had
to accept that as we all will. That's the advantage of technology after
all, to take control where you might not have had it before.
I like aligning my open/proactive arguments with the community policing
model to the extent that open/proactive broadcasting means interacting
as much as possible with the citizenry to build trust and ultimately to
reduce crime. That means accepting static from the public much the same
way we take all the 9-1-1 calls that we can handle. We know most calls
are hangups, pranks, underqualified emergencies, etc., but no one
suggests that 9-1-1 should be eradicated. The public value of 9-1-1 far
outweights the cost.

I believe proactive communications will take the same route. Police
will, in one example, decide to run a local police broadcast station on
the AM band. This station will mainly play recorded (and undoubtably

dull) information from the chief, sheriff, or some other authority about crime prevention and other details. But the police will proactively educate the public about this station: When there is a police chase, or when there is a felon running, or when there is some other danger or need, the police will break into the recording and announce it directly and immediately. The time between a foot officer knowing and a listener knowing will be minutes if not seconds. The public can participate in feeding information on these matters if it wants, but you're right: too much is no good. Therefore, police aggressively educate the public via brochures, pamphlets, classroom visit presentations, etc. on the proper way to "participate". There will even be a special phone number to call, and possibly citizen crime-watcher IDs (if you really want to get elaborate) to verify the caller and his history of participation. The medium could be anything: Cable (via a dedicated Community Police channel), the internet, the old-fashioned scanner radio (complete with a one-touch button that homes you in on the national "local police information channel", just like NOAA has for the weather). All these solutions are proactive, will certainly generate some trouble, but ultimately benefit the public in dramatic participation against crime.

Intermediate examples include police e-mail lists, fax broadcasts, etc. Say a car is stolen last night. The description, tag number, etc. can all be sent directly to me via e-mail. When I go check the mail, do the laundry, or whatever, I can make the cursory search around my apartment complex for the car and discreetly notify the police if I spot it parked. No confrontation, no fuss, no muss: Just a cleared crime.

> The media are usually only an annoying thorne in the side of the police and
> I agree that they rarely report the whole story, but listening to a
> scannner is'nt going to tell you anything you cant get off the police
> blotter. But even given this, I still dont see an overwhelming need for the

I'll even agree with you on the police blotter. But in Dave's World of Proactive Police Communication, that blotter is e-mailed to me every single day. To get it, all I have to do is subscribe to the mailing list. Or, watch the local cable channel where it scrolls by all day (voice-delivered emergencies as described above consist of the audio portion of this channel!). Or, it is faxed to me. The "walk downtown" is completely unnecessary.

> From my experience, so few people get involved, I still don't see a need
> for the public to be listening.. I dont really care if you do, but I dont
> see a need. I've never had a citizen investigate, or solve a case.

Well that's what community policing is trying to change. And I envision open broadcasting supplementing that effort today, and proactive communication supplementing that effort tommorow.

> Again, these are great to be informed of, but the numbers of people that
> take advantage of scanners are so few I don't see a need for departments to
> go out of thier way to see that everyone has access.

This brings us full-circle. People don't have scanners en masse' because scanners were never exploited as the crimefighting, lifesaving tools that they *could* have been. Had there been a 30-year headstart on the value of open or proactive police communication there would surely be a culture of advertisement centered around this very aspect. Instead, police scanners have received negative press. Even in researching my website I find nothing but one bad thing after another in which police scanners are the central instrument of doom. Police scanners, as tools, are POWER. It's the interpretation of that power that has afflicted them up to this point. Nothing else.

> I dint want that one criminal knowing when and where I'm comming to get
> them. I would fully support some kind of cable channel, or frequency where
> people could monitor some calls..like traffic hazzards, bad guys on the

Well then we really don't disagree that much for now. You seem to be headed the other direction than the one I'm headed in, but for the moment we are at an obvious intersect. I do believe cablecasting of standard patrolcasts is a viable solution for today, as is anything that allows access to the patrolcasts. Tommorrow, I like the proactive solutions I talk about. All the concerns you harbor specifically about criminal activity can be squelched through encryption on tactical frequencies. I will say, however, that if criminals with police scanners haven't beaten the police in 60 years of open broadcasting - it probably isn't that much of a problem after all. :)

Dave

If there is one thing I have learned from being a scan-head the last
few years is that ANYTHING going over the airwaves at any given time
can be received by someone with a scanner. I was scanning away today
when this bozo is making reservations on his cordless. Credit card #,
name, address, confirmation number, flight information, etc... all
given. This guy will definitely be hurt by some criminal someday.
I really think about it after owning one of these and has made me
a wiser person - HEY! scanning is educational. Nah, sounds like something
a politician would say...
Happy scanning...

I have a large number of former New York City Police Department Motorola MX-350 Portable Radios For Sale. These are 4 channel 1.5 Watt Uhf 470-490 Mhz. These units were taken out of service and are sold without channels. The Radios are in good condition and work.

Commerical Frequencies are available at additional cost. Unit comes with Battery & Rubber Antenna $ 75.00 each plus shipping. This is great for use as a scanner, hunting or simple point to point communications.

"E" Mail if interested.

Marty

A friend of mine bought a AOR8000 overseas and had it shipped UPS. The US Customs Service caught wind of it (they examine every package that is shipped from European and Asian radio suppliers). They sent an agent to my friend's house with the radio, disguised as a UPS delivery person. My friend paid the driver the custom fees--I think it was about $40--and took the radio into the house. A few minutes after, agents from the US Customs Service and the US Secret Service burst into his house, threw him on the floor and put cuffs on him. They charged him with intent to violate the EPCA, which carries with it a five year sentence and a $200,000 fine. Since it was my friend's first offense, the judge sentenced him to three years of probation and 200 hours of community service. He got to keep the radio though. He says it was the best deal he's made in a long time. Hope this helps!

I doubt they used a police scanner. It sounds more like they had
lookouts. In any event, given the sophistication of the criminal
element these days, the police should have confied their
communications to their MDTs or encryption on this kind of call. If
not the first time, certainly the second or third.

My recommendation to you to avoid this in the future is to buy a
police scanner and use it as part of your ongoing effort to keep drugs
out of your neighborhood. If you had had a police scanner first,
heard the call, saw the losers packing it up, you could have warned
the officers that the criminals were using their own scanner and that
they should arrive more discreetly next time.

Yours is a classic case where crime could have been eradicated much
more quickly if you, as a citizen, had taken advantage of open
broadcasting (assuming your area still has it). Unfortunately, police
scanners were never promoted as crimefighting tools as much as they
should have been, so you weren't aware of its potential - not your
fault. :)

Anyhow, I'm glad to hear the dealers are gone. Good show!

Dave

The benefits of an informed community are enormous. They just haven't
been exploited and therefore it may difficult for a lot of people to
comprehend them. But basically, they are what you might think if
given a few minutes:

* Police pursuits must often be broken off because undercharged
suspects pose a significant social threat in contrast to their crime.
An informed community knows which car to look for and can *passively*
track a fleeing car for miles into its own criminal nest. This is why
I advocate a 800 LIVE CRIME line in conjunction to a proactive
information service from the police. Cell callers can be the hundred
extra eyes and ears instead of a few dozen as represented by patrol
officers in cruisers, or expensive patrol air forces that few
communities can afford to any extensive extent.

* Police pursuits often cannot be broken off because of the serious
charges against the suspects. This poses a significant social threat
that cannot be averted. An informed community knows where the chase
is, and where it is going. Proactive information from the police
department can be the "EBS" of national defense. It should be LAW
that wherever police are allowed to chase suspects at all, means and
ways to inform the community of those chases be established.

* The organized media in your community is subject to the limits on
its coverage and depth of coverage due to staff limitations, budget
limitations, and even political pressures with local agencies.
Furthermore, it is questionable that there will ever be a truly
unbiased media. Access to live patrolcasts is a sincere effort to
bring reality and fact as close to the community as possible. It
garners a healthy relationship between police and community, and
prevents a pure alignment of media and government. Yesterday, only
two blocks from me, a car plowed into a laundramat, seriously injuring
one person. The police and medical departments have full knowledge of
this event. So do I (I have a scanner). However, no one else does.
It was not reported on TV, in the paper, or on the radio. I checked.
This example alone should be enough for anyone. You are subject to
the whims of some editor if you completely hand over your information

resources.

* Criminal activity in a local community may appear insignificant as a single report. Even down at police headquarters, information tied together via a computer tracking system may seriously lack the detail and niche element that only a single informed member of that community possesses. Criminals and crime itself is too chaotic and evolutionary for a single set of "experienced" minds to tackle. If a community is subject to the live information, that one person in a billion capable of clearing a crime, may come forward and do so. In short: Crime is everyone's fight, not just that of the professional crimefighters (who are far more exclusive in right to *confrontation*).

* The Utility aspect: Accidents up ahead, wires down, detours, chaotic felons on a rampage, the list goes on and on. Some organized media outlets may be quick in bringing this information to you over their own forums, but never "live". Those seconds, as anyone in fire and police work will tell you, nearly always count.

....in fact the list CAN go on and on. Every situation can in some way be helped by an informationally empowered society. I am aware and in fact, have acknowledged, that voice communications will someday be a thing of the past. That is why police departments need to begin working on a proactive solution: Community Police cable channels where live information is scrolled up all day line, dedictated public dispatchers to broadcast live criminal mischief information over the AM/FM broadcast bands...you can get creative as you want with it, but be PROACTIVE.

Make it count dammit.

Dave

((snip))

This only invites trouble, I personally dont want hundreds of extra eyes.
Hundreds of eyes means hundreds of calls to dispatch, which means hundreds
of "I saw him go north", "I saw him go south", "No..he went east..it was
east". I never really thought too much about it, we have had a few scanner
"call chasers" from time to time.. mostly it's those fucking annoying as
hell independant film crews that run from call to call hoping to get some
news worthy footage. I've personally written this one film idiot 3 speeding
tockets, I'd be happy if he was shut out from listening. Air support falls
within "Mutual Aid", our chopper will respond to other cities for free on
most emergency calls.

> * Police pursuits often cannot be broken off because of the serious

> that wherever police are allowed to chase suspects at all, means and

> ways to inform the community of those chases be established.

Why?..this "informed community" you speak of are the same idiots that gathered on the freeway during the OJ chase, I dont want that happening every chase I get into. I suppose listening as a hobby is fine, but getting involved in mass... no thanks. Most of the pursuits I've been in are over in minutes, usually less than 10. If, as you say, a community is to be informed...everyone would need to have a scanner on at all times and they would have to be actively listening and understanding whats going on. How many people do that?. I'd be willing to say that over 90% of the public does'nt even have a scanner.

> * The organized media in your community is subject to the limits on

> *unbiased* media. Access to live patrolcasts is a sincere effort to
> bring reality and fact as close to the community as possible. It
> garners a healthy relationship between police and community, and
> prevents a pure alignment of media and government.

The media are usually only an annoying thorne in the side of the police and I agree that they rarely report the whole story, but listening to a scannner is'nt going to tell you anything you cant get off the police blotter. But even given this, I still dont see an overwhelming need for the public to be listening to radio calls. It's great for a few law abiding citizens, but how about the criminals that use scanners?. I realize using a scanner during the commision of a crime makes it a federal offence, but they still do.

((snip))

> * Criminal activity in a local community may appear insignificant as

> everyone's fight, not just that of the professional crimefighters (who
> are far more exclusive in right to *confrontation*).

From my experience, so few people get involved, I still don't see a need for the public to be listening.. I dont really care if you do, but I dont see a need. I've never had a citizen investigate, or solve a case.

> * The Utility aspect: Accidents up ahead, wires down, detours, chaotic

> police work will tell you, nearly always count.

Again, these are great to be informed of, but the numbers of people that take advantage of scanners are so few I don't see a need for departments to go out of thier way to see that everyone has access.

> ....in fact the list CAN go on and on. Every situation can in some way

> live information is scrolled up all day line, dedictated public
> dispatchers to broadcast live criminal mischief information over the
> AM/FM broadcast bands...you can get creative as you want with it, but
> be PROACTIVE.

I applaud your passion, but as an officer I think our frequencies should be secure from prying ears. You seem to be a decent law abiding kinda guy, but I dint want that one criminal knowing when and where I'm comming to get them. I would fully support some kind of cable channel, or frequency where people could monitor some calls..like traffic hazzards, bad guys on the loose ect... I think the advent of MDT's nixed most of your listening anyway. Soon my dept will go to MDT's, we're even getting tatical laptops so we can basically e-mail via the airways our reports. We'll get calls over the MDT ect...

Good luck with your fight, I actually could care less either way. From a safety POV, shutting out the media and criminals would only help.

523. Re: LAPD Patrol area list and call signs

Newsgroup: rec.radio.scanner
Date: 1997-02-05 00:00:00 UTC
From: pvboy33@aol.com
Message-ID: <19970205131201.IAA07866@ladder01.news.aol.com>
Source record: 208835

OK... Take notes, here we go...
Unit Callsign = <numeric> <alpha> <2 digit numeric>
1st Numeric = Division Number, full list to follow
Alpha = Type of unit, ie. Adam = Two man patrol
2nd Numeric = Beat

ie. 1 Crash 81 = Central Division Crash Unit in beat 81

Codes:
RD = Reporting District (geographical area)
PR = Party Reporting
Code 30 = Burglar Alarm

Most of the others are fairy standard for california

Now... Divisions, yes... there are eighteen of them

1 Central
2 Rampart
3 Southwest
4 Hollenbeck
5 Harbor
6 Hollywood
7 Wilshire
8 West L.A.
9 Van Nuys
10 West Valley
11 Northeast
12 77th Street
13 Newton
14 Pacific
15 North Hollywood
16 Foothill
17 Devonshire
18 Southeast

Some divisions use the same dispatch channel... these are
Pacific & Wilshire; Southeast & Harbor; Northeast & Rampart; Newton &
Hollenbeck; West Valley & Van Nuys

If I missed anything, let me know.. preferably via e-mail... And I hope
this helps y'all outside of LA listening to our finest on the world wide
web...

>for unauthorized use of radios on public safety frequencies.

>It may be better to find another hobby instead of horsing around on
>police radio frequencies.

Just to share an interesting sidebar... Recently in a South Los Angeles
County city, a fairly small name (the names have been changed to protect
the innocent) we had a instance where someone had the CTCSS tone for the
inbound side of the repeater, and a digital recorder/player
(supposedly)... After an officer made a transmission on the primary police
frequency, the officer (and everyone else) would hear his transmission
replayed through the repeater. Imagine a 30 second crime broadcast being
rebroadcast for another 30 seconds on a busy Friday or Saturday night...
Yea, it was frustrating... They had to use the secondary channel for a
time, until all the radios could be programmed with the new CTCSS tone..
Never caught the person(s) who did it, but I wish they had...

Mega Dittos,

Unfortunately you will most likely get a nice note telling you that you
have voided your warranty. The mod is probably the first thing they will
look for and in the unlikely event they do just fix it, they will be
required to undo the mod when they send it back to you.
```

I recently programmed the LoJack frequency into my scanner. Yeah, I know, that's right up there with listening to garage-door openers! Anyway, this morning I heard a voice transmission on the frequency. The signal was weak but sounded like a dispatch location giving general coordinates of an activated LoJack (North of Road A, west of Road B, etc.).

I was under the impression that the LoJack transmitter in the subject vehicle simply transmitted a signal (Modulated?) and the police used direction finding receivers in their cars. Can anyone on the group clarify for me how this works?

< a whole lot of posturing and noise snipped >

At the risk of getting involved in a flame war, let me ask a few pointed questions:

How do YOU define "memory effect" and how does one differentiate this effect from the very similar effect which happens when a cell is over charged (and gasses off). In other words, how can one be sure that the effect one observes is that of "memory" and not "over-charging"? Or are these effects one and the same thing?

Further, is it a reasonable assumption that some of these "battery conditioner" devices may actually cause an over-charged cell to rejuvinate?

I'm not taking sides here. I've read an awful lot of educated articles which seem to be pretty evenly split on the issue. Please post theories, references, speculations, whatever --but try to keep the noise level down. I want to read about ideas and opinions, not personal attacks and/or posturing.

BTW: I use NiCd batteries at work too. We have them in all sizes from those used in portable radios to those huge wet cell beasties used to power terrestrial microwave stations and utility substations. I have more than just a passing interest in this issue. If these NiCd batteries (or the chargers) fail I could watch a substation burn to the ground, or even see a Hydrogen gas explosion blow apart a building (both have happend where I work).

I'm not going to get into the question of whether memory effect happens or not. I think I'll stick to non-controversial issues like religion, evolution, affirmative action, etc.

However, there's one thing I have noticed. I've heard a lot of people complain about memory effect in NiCd batteries. I make it a point to ask them what actually happened. In probably 75% of the cases, the symptoms described don't match the "memory effect", they match the "NiCd death" effect. Most of the time it seems these people are describing what happens when one cell of a NiCd pack dies completely and won't hold a charge.

I'm not saying that there is no memory effect, just pointing out that there are other failure modes of NiCd batteries. I think some of the fear of memory effect comes from unrelated NiCd failures.

I think that in normal commercial usage of normal commercially available NiCd batteries, the failure rate is somewhat high, no matter how well you treat the batteries. Some particular types or batches of batteries do seem to to better or worse than others, but "random" failures are too high in general, IMHO. Also, you can make the faiure rate worse by reverse charging or overcharging NiCd's, of course.

537. Bob Grove Testifies Before Congress on Scanning

Newsgroup: rec.radio.scanner
Date: 1997-02-05 00:00:00 UTC
From: larry@grove.net
Message-ID: <5dadkc$7bp@news2.his.com>
Source record: 208849

Just minutes ago Bob Grove, President and founder of Grove Enterprises presented his opening statement in hearings before a House of Representatives subcommittee investigating cellular telephone industry privacy and scanner listeners titled "Is Anybody Listening? You Betcha!" Grove was invited to testify before the subcommittee by Mr. Billy Tauzin (R-LA) chairman of the House Commerce Subcommittee on Telecommunications, Trade, and Consumer Protection.

For those of you who missed Grove's opening remarks to the committee on behalf of the hobby on C-SPAN2, here are those remarks. I understand that C-SPAN2 had to cut away from coverage but will replay the entire hearing later today. Important legislation could be generated from the committee that could have serious impact on the scanning hobby. Watch for potentially damaging legislation to scanner listeners originating in the House soon and stay in touch with your government legislative representatives.

I hope that the message of this potentially damaging legislation by our elected officials in Washington DC to our scanner hobby gets the widest possible dissemination.

==========
CELL PHONES AND THE RIGHT TO PRIVACY: A COMMENTARY
By Bob Grove, President, Grove Enterprises; Publisher, Monitoring Times

Technically unsophisticated Americans are astounded, and often outraged, upon learning that their cellular telephone conversations are broadcast openly, and that anyone with a variety of receiving devices can listen in. They don't blame the listeners as much as the vendors who sold them the phone with no warning from the salesperson or in the instruction manual. To the contrary, irate customers report being reassured that privacy is not a problem because it is illegal to listen in, modern scanners don't have cellular frequencies, and that frequencies keep switching among over 800 channels, making following a conversation nearly impossible.
Scanner owners and other citizens agree that Americans deserve a reasonable expectation of privacy, but broadcasting a clear voice into the airwaves and expecting it not to be overheard is not reasonable. They see the analogy of walking down a crowded street naked and expecting no one to look, or talking openly in a crowded room and expecting no one to hear.
They feel that the responsibility of security should not be placed on the shoulders of the scanner hobbyist, but on the service provider, ust as it has always been on wired telephone services, and all other

radio communications services, including law enforcement and even cordless telephone manufacturers.
With the Cellular Telecommunications Industry Association (CTIA) an ever-present specter behind the drafting of repressive listening legislation, the cognizant public perceives the Electronic Communications Privacy Act (ECPA) as a fiscal expedient of the CTIA, lobbied into law to provide a no-cost alternative to offering their customers real privacy, and endlessly blaming the harmless hobbyist for listening to his scanner. Public suspicion is heightened when they learn that these restrictive regulations are added on as eleventh-hour amendments with little or no time for legislative reflection or a public comment, or when hearings such as this one invite their representation at the last minute with virtually no time for preparation.
Americans resent government repression of their rights, and freedom of the airwaves has been traditional for decades. But over the last decade, this freedom appears to have been eroded by the multi-billion-dollar cellular telephone lobby for their profit advantage. The ECPA and the subsequent Cellular Amendment to the TDDRA have singularly imposed, for the first time, listening restrictions in the United States which are more severe than in Canada and some other developed countries.
Among the estimated 10-20 million scanner owners in the United States, flagrant violations are extremely rare, certainly far fewer than among gun owners, and scanners don't kill, yet a hefty fine and lengthy jail sentence await the hapless scanner listener who merely tunes in on an anonymous telephone conversation. The general impression by the wary public is that even this hearing may be a facade orchestrated by the cellular industry to impose further restrictions on the general public, thus perpetuating the
illusion of privacy, rather than adopting existing technology to provide real privacy to their trusting customers.
If cellular telephone conversations were digitized as long promised by the cellular industry, all of these hearings, charges and ountercharges, legislation and regulations, indictments and fines, and costly policing of the cellular frequencies--all at the taxpayers' expense--would be unnecessary. All restrictive laws pertaining to scanner frequency coverage and cellular eavesdropping could be rescinded. No one could hear the conversations. The traditional American freedom of the airwaves could be returned.
The public perception of Congress as a shopping mall for big business can be largely corrected by this group of legislators. Instead of indicting citizens for listening to their radios, or blaming small American entrepreneurs as straw men, face the industry that is refusing to cooperate. Tell them that Americans deserve privacy, and the only way to insure it is to implement the inexpensive, effective technology they promised many years ago, the same level of privacy offered by other, more responsible, communications services.
==========
Additional materials that were presented to the committee can be found

on the Grove web site at: http://www.grove.net. Ladies and genetlmen, we could see some of the most restrictive legislation ever on our hobby come from this subcommittee. Stay on top of this and let your elected officials know how you feel right now or run the potential for our hobby to suffer another round of even more restrictive laws from Washington. Do it today before it is to late.

Hi fellow scannists!,

In the end of March I'll be flying from San Francisco, CA (SFO) to
Pittsburg, PA (PIT), then to Rochester, NY (ROC). I'm looking for
frequencies/info that might come in handy sitting for an hour in the
terminal at Pittsburgh. (Any freqs for SFO, PIT, & ROC would be
appreciated, as well as police/fire/airport/security/crash crews/etc..
frequencies.)
Please email me info at:

socks@community.net

Thanks in advance!!!

544. Baby monitor reccomendation (?)

Newsgroup: rec.radio.scanner
Date: 1997-02-05 00:00:00 UTC
From: Coachman <Coachman@mindspring.com>
Message-ID: <01bc1389$599add60$54121d26@default>
Source record: 208856
Cross-posted to: misc.kids,alt.consumers.experiences,misc.consumers,misc.kids.pregnancy,rec.radio.scanner

I'm researching baby monitors. I'd like to get one with good
reception and a pretty strong signal, enough for the remote to
pick it up while in the yard. If it's *so* strong that the
neighbors can tune in, no big deal-- it's not like I'm running
a meth lab or something! :-)

So far, all I have found relevant on the net is this little snippet on
DejaNews, from November:

>> I have seen a number of baby monitors on the market. I would like to
know
>> if the Fisher Price monitor is the best, what about the Playschool
>> monitor? Any feedback would be appreciated.
>None. Save your $ and go to an Office Depot type office supplies
>place and get a nice 2 way intercom. In the US they cost similar
>money, yet the intercom has *much* better sensitivity, is two ways
>(can use later on), and looks a lot neater. I got the Fischer
>Price before I found out.

Well, I don't want an intercom, but a portable monitor. Any more
reccomendations?

I have a C50 question. According ot the boot load section of the
databook, it says that their are several methods of loading an external
program in to internal memory, however if you look at the schematic
for the cheap-O kit, the bus is not set for the 8-bit parallel load
at FFFF (uses *BR,*DS at reset).

Is it possible that the 27C256 has the appropriate bits set?

Doug

I recommend that you wait until after your baby is born to see if you really need one, or not. Many parents choose to have their babies sleep in bed with them, or in the same room with them, especially during the first few months, or even longer. This is especially convenient if mom is breastfeeding. There is nothing strange or wrong with co-sleeping, and many parents who were completely repulsed by the idea during pregnancy, find themselves happily sleeping in the same room with their babies after his/her birth. You may want to wait and see if you can save yourself the expense of something you may not need. We wasted our money on baby monitors, a crib, crib bedding, mobile, etc. Dr. Sears recommends that you save the money you would've spent on these things for the baby, and spend it on the mother instead! :-)

How about a twist on your idea. Call back the pizza shop and say you changed your mind and add a few toppings - or change everything all together.

How about listening to a conversation of someone you know (a neighbor - preferably one you don't like....). While they are talking, call them (disable callerid) and wait until they say to hold on for another call. Hang up before they click over. Then they click back saying "oh well, they hung up". Keep doing this and listen to how much more annoyed they get when they click back to their original conversation.

Goes over great at parites. Simple amusement for simple drunk people.

Well said. We WERE having a good discussion here about this subject
until an unnamed guy in Malawi showed up spewing arrogance and hatred.

That makes it impossible to carry the discussion on, so until people
want to have a discussion without flaming, spamming and general hate
and discontent, it won't be a worthwhile conversation. Sometimes it's
hard not to take the bait, regrettably some of us took it and certain
people delight in this.

If anyone wants to conduct a reasonable private discussion via email,
that's the only way to discuss this subject any further.

Thanks,

Jon

We used a Gerry monitor (bought in 1993) when we were outside doing yard
things while our first child had his afternoon nap. It seemed to work just
fine, even if we were on the other side of the house. We did occasionally
pick up a neighbors monitor though.

I think that there is no law anywhere that states you can't record a
conversation over any phone line anytime as long as one of the parties
in the conversation is doing the recording. The law is about THIRD
PARTIES not involved in the conversation. That is WIRE TAP. The
police department is involved in the conversation. Now there is a law
that states a beep has to be inserted on the line to notify the caller
that the conversation is being taped. But it is not inforced.

We are about an hour from hearing the verdict in the OJ Simpson civil trial. LAPD is currently deploying special operations status in preparation for this verdict, and it is awesome! I'm listening right now throuh www.policescanner.com.

It's true, you can use some HAM radios to broadcast on many police frequencies. My buddy, who's a ham, once called in a GTA in progress that he obs'd while driving to work. I was working and was could'nt believe my ears, his signal was even stronger than 90% of the units in the field.

My buddy was driving his POV and following the suspect, it worked out pretty good, but I would'nt want any regular joe being able to do that on our main channel

568. WANTED: CB Shop Information!!

Newsgroup: rec.radio.scanner
Date: 1997-02-05 00:00:00 UTC
From: teamwin01@aol.com
Message-ID: <19970205020601.VAA13796@ladder01.news.aol.com>
Source record: 208899

HELLO TO ALL OF YOU THAT BUY, SELL, TRADE, AND OF COURSE THOSE
WHO TINKER WITH CB RADIO EQUIPMENT!!!

No, No, Don't go away yet, I'm not selling anything.

I'm compiling information on CB radio shops around the U.S.A to put
together a
brochure to get information to all my fellow CB'ers about CB shops that
are in or
around your area that you can rely on for your CB & ANTENNA needs, wants,
or for whatever purpose.

I have never seen such a brochure, So I thought I would put one together,
because I know there are alot of places out there that you and I don't
know
about.
So, put your thoughts together and E-mail the complete name, address, and
phone number of any CB SHOPS, SHACKS, HUTS, OR EVEN ON WHEELS,
to me.
Feel free to make comments good or bad about the shops you know of,
and together we can help old-timers as well as new-comers in deciding
where
and how to buy, sell, trade, or even get service and repairs.
Some say," CB's are a thing of the past".
I say," BULL *$#@&^)+ ON THAT"!!!
If you wish, you may copy this letter and post it in other net-works
systems
to help us get the word out to as many people as possible.

This brochure will more than likely take a few months to put together,
so keep an eye out in the future for this ad (CB SHOP BROCHURE)
Lets bring life back to the small shops that are being trampled on by
the big
guys. Let's give them a run for their money.
Thank you for your time and I hope to hear from you soon. Or, drop me
a line
and let me know what you think of this idea. The sooner I receive the
info.,
the sooner the brochures can be completed.

NOTE: When I receive your info. on CB shops, I will E-mail you with the
number
I have listed at the time.

THANK YOU AND 73's FROM COLORADO!!!!!!!

From the FAQ:

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[...]

Aside from a scanner and antenna, the most useful piece of
equipment for sleuthing is a voice actuated (VOX) cassette
tape recorder. You don't need a high fidelity model or
anything fancy. I use two modified Radio Shack CTR-75
recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of
monitoring onto a single tape. I often leave a recorder
"armed" and connected to a scanner at home while I am at
the office or doing something else. When call letters are
mumbled, I can play and replay the tape until I hear and
understand them.

If you don't have a VOX recorder, consider a device like
the NiteLogger II tape recorder controller, made by
Benjamin Michael Industries. It connects simply between
scanner and recorder and contains sound activation
circuitry to trigger the recorder.

Hi all,this scanner seems great..but..
I have heard of a lot of things people
complain about it not having.
Are there any plans in the works to
bring it up to speed or make it
more suitable to the North Amearican market?

It's so small and I hear it's quite a receiver
for the size of it!
I forget what people have commented on about it's
audio?
Someone with one,let me know!

Thanxx

Places and organizations that can normally be expected to tape
telephone calls (such as police departments) are generally exempted
from such regulations.

I have been trying to listen to LAPD but the audio is very broken. Has
echos and is hard to understand. I wonder why they don't just leave
the scanner on one channel so you can follow the action...
I guess so many users were connected that it slowed the data stream
down tonight.

Okay, here goes...

US Coast Guard Transmits FEC (Forward Error Correction, or Sitor B) broadcasts with Urgent Marine Info Broadcasts, Weather forecasts, Notice to Mariners, and other navigational info.

The Coast Guard also broadcasts via Navtex, which is similar to FEC, and can be monitored with a standard Sitor or Amtor decoder. Baud rate is 100 baud.

Maritime Safety Information (MSI) Broadcasts

Navtex 518 kHz

NMC Camspac San Francisco, CA

> > 51 High Street, Portland
> > Dorset, DT5 1JQ, United Kingdom
>
> Clear as mud.Ok, I'll try:
If the person on the land-line side of the conversation has a conventional home telephone, you'll probably hear both sides. If the person on the land-line side of the conversation is also on a cellular telephone, or on certain kinds of business phone systems, you'll only hear the land-line side of the conversation from the cell site. The reason? From the cell phone, the conversation has 2 distinct paths - a transmit path from the cell phone to the cell site, and a receive path from the cell site to the cell-phone. After it goes thru the cell site, and cell switch, it still is split, an remains so all the way to the phone company. When the call orriginates from, or terminates to a home telephone, these paths are put together with something called a hybrid. The conversation's transmit, and receive goes to the home on the same set of wires. Most of the receive (to the home phone) audio gets converted back into sound at the phone, but some is reflected back. (depends on impedance match, and other things and is called echo return loss, but beyond that it gets real complicated) In case of SOME business telephones, and calls to or from other cell phones (cell fone to cell fone), the receive audio is carried on facilities (digital carrier, 4 wire trunks,etc...) that NEVER allow it to be passed back as transmit audio. Receive goes only to the receiver in the phone, transmit audio only comes from the transmitter. Another factor, in the case of long distance calls is something called echo supression. You make a call from your home in new york, to a home in california, your voice goes thru echo supression units on both coasts. You talk from new york, the echo supressor in california shuts of the transmit audio while it's receiving you. Same thing both ways. It takes about 1/8th of a second each way for your voice to travel coast to coast (186,000 miles a second doesn't

really enter into it - it's equipment delay) , and the delay (echo) would confuse you. This accounts for the little pieces of audio you may sometimes hear. Speaker phones contribute to some of these situations also. Hopefully this is clearer than mud, but this is REALLY what's going on. I cannot explain it any differently.

> Anybody got any info on the new Vlink system that WalMart is pushing?

The following is a list of frequencies for the new V-Link phones
from "YES! Entertainment Corp". The Phones (Walkie-Talkies) run
around $70 and can be purchased at Toys R US, WalMart and EBX
stores. An optional Nicad Battery with Charger can also be
purchased for an additional $30.

916.8750 Calling Channel 1 (Main/Home Frequency)
915.8625 Calling Channel 2
915.0000 Calling Channel 3
914.0875 Calling Channel 4
913.3375 Calling Channel 5
912.0000 Calling Channel 6
910.9125 Calling Channel 7
910.2375 Calling Channel 8
909.3375 Calling Channel 9
908.5000 Calling Channel 10
907.6625 Calling Channel 11
907.0000 Calling Channel 12
906.3375 Calling Channel 13
905.6625 Calling Channel 14
904.5000 Calling Channel 15
904.0000 Calling Channel 16
903.4875 Calling Channel 17
903.0000 Calling Channel 18
902.5000 Calling Channel 19

I obtained a set from Toys R US and found that they're using
916.875 Mhz for the main calling freuquency. The units seem to
switch to another freuquency only if you two party lines were
active at the same time.

If you place the phones in Private mode, they switch frequencies
once a link has been established between two phones.

The phones do not appear to be using DCS or CTCSS.

I've also noticed that if a link goes inactive (you haven't keyed the
link switch for over 10 seconds) the units get lost, and unless both
parties hit the clear switch, there doesn't appear to be away for the
two parties to establish another connection.

They also have a maximum range of 1000 feet at best! (NOT 3 blocks!)

For the money that you will be paying, I would recomend an FRS radio from Motorola or Midland.

Bob

ONLY 10 TABLES LEFT - R E S E R V E B E F O R E I T'S T O O L A T E !

The Long Island Mobile Amateur Radio Club is please to Invite you to our Winter 1997 HAMFEST on Sunday February 16, 1997.

Loaction:
The New York State Armory
63 Babylon Turnpike
Freeport, Long Island, New York

Time:
9:00 am - 2:00 pm General Public
Doors Open at 7:00 am for Sellers

Admission Fee:
$6.00 general Admission

$25.00 / 6ft table (LIMARC Supplied) for vendors

Contact:
Send all checks (made out to LIMARC)
To: Mark Nadel, W2OT
22 Springtime Lane East
Levittown, New York 11756-4419

Additional Info:

- Call the LIMARC Information Line 24 hrs/day at 516-520-9311.
- There will no amateur radio exams given the day of the hamfest.
- All Reservations for tables MUST be in advance, No tables will be sold the day of the hamfest.

Goes back to the old argument hams have with electronics manufacturers.
For the cost of a few simple pennies TVs and stereos could be made much more
RFI-tight. However, the manufacturers would much better have the hams be
yelled at by thier next door neighbors and let the hams deal with explaining
to the neighbors how the RF interference is not thier fault, but the fault
of the manufacturer for using plastic here and there, and no shielding
whatsoever in the contruction of thier equipment. But people don;t realize
it's not the ham's fault. They assume that the manufacturers are already
using the latest technology to block out unwanted interference. That's
absolutely false. It's called "saving a buck." I'm sure the same mentality
works in just as lively a way in the aircraft industry. Rather than install
RFI reduction, they'd rather save a buck and make the use of radio frequency
devices a no-no. I consider it a stupid and dangerous policy myself. You
NEVER, EVER trust the general public to do what is responsible. There is
always one jerk who just can't abide by the rules like the rest of us can.

Yes. It is part of the AMPS standard. The power levels are
standardized in specific steps..sorry I forgot what those steps are.
It's a necessity to reduce co-channel problems on high density systems
where the cells are small and channels are reused close by.

This used to cause me trouble when I was testing phones several years
ago (back when everyone had $3000 mobiles that we charged $200 to
install). The easiest way to check the antenna was to place a call and
look at reflected power with a wattmeter. If I was checking a phone
close to a cell site it immediately steped to low power (like less than
100mW) and I couldn't read any forward power on a 10 watt scale - let
alone see any reflected power.

An example would be calling the main number (operator switchboard) at a large corporation such as the one I work for (in CA). All calls to our operator are recorded without any beeps or signals. This is because the law recognizes that when you call a primary operator number it is not unreasonable to record the call.

Other phones at our facility cannot be recorded without permission or the appropriate signal/beep. This includes oiur security control room and emergecny numbers.

The police really do not need to put a beep on 911 lines. They are often there because everything going to these answering positions is recorded, including non-emergency lines.

Isaac,

Sorry, can't agree with the "discharging all the way done" statement. Think of your car battery, when you are driving your car. It is constantly accepting a constant charge from your alternator via the regulator. Those two devices are working CONSTANTLY topping off the battery dependent on the voltage measured in from the battery. Hell, I can't tell you how many times when I was a teenager washing my car in the driveway I would discharge that ole Motomaster battery down til the tape deck would die. I would snap a charge into the battery, run the car for about twenty minutes and do it all over again..a hundred times over again! No shorts.

A "shorted cell" is more of vibration abuse than your electrical mentionings. NO correlation to the state of charge.

I would like to know the "proper ways of charging nicads" that you maintain as necessary. FYI, There are ONLY THREES methods currently (pun intended!) used to detecting the end of charge. They are as follows with the least common at the top:
THE THREE METHODS OF NICAD CHARGING

1) No indication at all, they are relying on you to stop the process.This is the cheapest one out there, Off the top of my head I can't think of any made nowadays or lthe last five years using this method. As most have gone kaput by now ,THEY ARE RARELY USED!

2) A sensor to measure the rise in HEAT being given off by the cells (once the NiCad "is charged" the electrical energy is no longer being converted into chemical energy and as energy can neither be created or destroyed it is converted to heat). Quite a few use this method. That is why it is recommended that NiCads may not accept a charge after a prolonged discharge since the NiCad may be warm and therefore "fool" the charger. Let it cool down, then charge it.

3) The following is the most expensive method. When a nicad is put in the charger and it's near the end of charge the voltage accross the cell is low nearing 1.2 volts. As it accepts charge, voltage rises slowly until it reaches.
peak charge (1.5-1.65 v.) the voltage levels off. Almost as suddenly, the voltage accross the cell will DROP INSTANTANEOUSLY as the chemical charge will then start to convert to heat. This "drop" is noticeable if you put a good 6 digit digital voltmeter and is somewhere around 25 to 35 millivolts. This detection in the decrease in voltage is all that is required to trip the cycle off and thusly alert the user that the NICAD is thusly charged.

That is it. Finito. There are no other methods being utilized in the Nicad industry.!

Robbie (model car fella), you are absolutly right! I use a method that overcomes the weak cell you mentioned previously that utilizes a series resistor (100 ohms). As you have said, the stronger cells get to max. charge first before the weak ones will. This method will allow the weak cells the ability to catch up to the stronger ones. e-mail me at 71162,2725@compuserve.com and will be more than pleased to provide the extensive set-up I use. It sounds like a waste of time but passed experience has SHOWN me that it makes a difference.

I was recently given an old radio shack scanner.

The model is labeled "PRO-38, 10 channel direct entry programmable scanner."

I do not know how to use it, yet, but would like to pick up the hobby. Is there any FAQ or WWW info. resource to learn about scanning?

Any info on the scanner model or Toronto freq.s appreciated.

I'm wondering - of course - if my scanner is old enough, or Canadian enough, to listen to cel phones? (seems like a small, old model - probably doesn't go high enough?)

Cheers,

DkC

:>>>>>>> "Of course, if you have a second scanner, you could punch in the cell site frequency minus 45 MHz and hear the mobile unit, but reception is much more difficult. Most people have 0.6 watt handhelds, and if they're close to a
cell site, they may only be running a few dozen milliwatts."<<<<<<<

++This is true with the new digital phones (they can vary output wattage), however I am sure that *many* analog phones transmit the full .6 watts at all times.

Does anyone know about the varying analog output on cell phones?

How about the analog mode on digital phones (where digital sites are not available, the phones can switch between digital and analog, even on the same call). Can the phones vary output when in analog mode?

I tracked down a juvenile kid who was making obscene phone calls at the same time every day. He'd go thru the phone book and call, say, pizza places and talk trash to females who answered.

I figured out his name, address, and phone number from other calls others made with the same phone.

When the kid started calling again, I called HIM and told him that if he didn't stop making obscene phone calls I'd tell his parents and call the police.

I never heard that phone on the air again. I can only hope the little rascal stopped with the calls too.

.....

I agree. If some people would use a simple rule of thumb which is don't say something on cellular or cordless that they would want someone else to hear. Use a corded phone or other secure method. I know that sometimes a person can't wait and must use a unsecure method of conversation. With that they should just grin and bear it because they know that they can be heard. Instead of whining to their mommies and daddies that someone can hear me on my phone.

Another thing that ticks me off about this subject is that some people that hear of this subject now think that everyone in the world has a scanner for one purpose and that is to listen to other peoples conversations. I hate to inform them but I know a bunch of people who are volunteer firemen and some policemen use scanners to assist their community. I, a volunteer firemen, use my scanner to listen for calles for my department.

So people WAKE UP and smell reality, use common sense when monkeying around cordless or cellular phones!!!

621. US lawmakers investigate scanners and privacy

Newsgroup: rec.radio.scanner
Date: 1997-02-06 00:00:00 UTC
From: Brian Gohl <bgohl@spiritone.com>
Message-ID: <32F9D2CF.2BE6@spiritone.com>
Source record: 208631

When I started watching the Cellular Phone Privacy proceedings I thought, "Great, Bob Grove is there to defend the scanner owner". But now I feel that it was truely a mistake to have Bob Grove represent the scanner owners interest at these crucial hearings. While it is true that he has the knowledge and attempted to represent scanner owners, he also has ties to the modification industry. Instead of being able to stand up for our rights to legally monitor, he was forced to fight for his interest. This tainted any beneficial testimony that he gave.

In a statement siding with statements by the wireless industry, Rep. Tauzin grouped all scanner owners / monitors into techno-voyeurs that need to have their privileges of monitoring any conversation made illegal. He seemed to be suggesting forthcoming legislation that made any point-to-point transmission a protected form of communication. Instead of acknowledging that a great majority of millions of scanners in use today are receivers manufactured prior to the cellular monitoring ban, the bulk of testimony believed the threat to be from receivers illegally modified. Very little of the testimony even considered the fact that legal monitoring was made illegal to protect an insecure form of communication during the conception of the cellular phone industry. Unfortunately there was very little comment concerning the wireless industry's initial lack of providing a technical means of secure communication.

The hearing continued to return to the fact that even though digital communications are offering a higher degree of privacy the majority of wireless sales continue to be analog. This was coupled with a survey which indicated that the majority of wireless consumers aren't concerned about interception enough to even spend an extra $20. to insure privacy. It still comes to the fact that business continues to make a profit and consumers need to be aware of the trade-offs in technology and what is lost to save a few bucks. I then thought to myself, "why then are they having a hearing if the people that they represent aren't concerned". Well, it all comes down to the fact that one of their own got caught because of previous bad legislation protected cheap business practice and didn't properly address secure communications.

Our culture is built on trust and consequences. I trust that my neighbor won't open my mail, take a second to break a window or lock and enter my home, steal the pink flamingo from the yard or the Union 76 ball from my car antenna or even to climb fences to cross though my yard. But I'm not ignorant! I also need to be aware that these things can happen and I need to take reasonable steps to insure that my belongings are secure when possible and my privacy is protected. If someone doesn't respect reasonable expectations of ownership and privacy then there are varying

degrees of consequences.

If I post a "no Tresspassing" sign on my private property, I have reason to expect compliance. Imagine what the result would be if I posted that same sign in a public park! The same needs to apply to legislation relating to communication. Laws need to be in effect to insure that the honest remain honest, not that the honest become guilty because public become private. If privacy and security are promised in business brochures the industry needs to take steps to introduce products that fulfill the product description.

The revelation of how scanning of cellular frequencies have hindered investigations is unfortunate. Those making a profit or hindering the investigation utilizing information gathered through illegal means should be held resonsible and prosecuted. The blame also should be shared by those who use insecure communication for sensitive materials. I find it unbelievable that the FBI would be using unencryted communications for any sensitive material irregardless if it be wireless or hardwired!

It seems that a few Representatives of reason are seated on the Communications Commitee. Rep. Eshoo, Klink and Cox seemed to have a better grasp on the broad subject. I can only hope that in future hearing those of use who enjoy scanning as a hobby will be better represented!

We have a Safety First Nursery Monitor. My daugher is 9 months old and
it has worked great for us so far. The transmitter clearly sends sounds
to the receiver. The receiver has lights that display the increasing
sound level. It also has an alarm clock to assist with naptime checks.
The receiver also has a rechargeable battery that is constantly
recharged when set in its stand. This is something that no mother or
father should be without.

>So come out from under the bed, and keep
>your paranoia in check for a bit.... It isn`t going to happen.

This is exactly what the Russians said pre-Lenin and the Germans said per-Hitler.

Wake up, man! These days, the constitution is trashed routinely by liberal democrats and the heavy hand of government attempting to protect us against ourselves.

Consider the trampling of private property rights...either by "environmentalists" who dictate whether or not and in what manner you may use or modify your property...or by local governmental entities who pass laws restricting what color you may paint your house, whether or not you may park your car in your driveway, and...our favorite...whether or not you may attatch a radio antenna to your house or place it on your property.

How about mandatory seat belt laws, search and seizure laws (which allow the taking of property even though there is no proof that a crime has been committed), roadside checkpoints (whatever happened to "probable cause?"), etc., etc. etc. I could go on and on about how individual rights are violated in this country on a daily basis, but you get the point. Given the history of government in this regard, I wouldn't be at all surprised to see a ban on scanners, block converters, modification instructions, etc., to be enacted into law. Enforceable? Of course not...but then again, neither was the original ECPA laws, and Congress knew it when they passed them. By the way, when the original ECPA was being proposed in 1986, how many of you said "It isn't going to happen. This is a free country and the Communications Act of 1934 allows us to listen as long as we do not divulge. It will never happen."

Think again.

Yesterday, a subcommittee on telecommunications held hearings, shown on Cspan2, concerning cellular phones and privacy. A nervous Bob Grove (Monitoring Times) and several other industry and enforcement folks discussed the issues (inside a 5 minute time limit).

As thought earlier, the folks from Florida have stirred up a large hornet's nest. Suggestions heard yesterday included going the full digital route on cellular phones, "hardening" the insides of a scanners to prevent tampering, and, of course, changing the penalties for listening in.

I didn't see any report on this at the time I posted this message so I thought you might be interested in a small portion of the proceedings.

Garfoon (garfoon@aol.com) wrote:

: 1) Had anyone seen a FAQ on the best way to use the Scout? The instruction
: manual is not the best for real world usage.

I haven't seen a FAQ. I was thinking of writing one, perhaps I should get motivated and do it.

: 2) Why does it only seem to use NFM? It seems like 90%+ of Scout hits
: cause no signal to be received by the AR8000 even though it is reaction
: tuning. It hit's on CB's all the time but they are AM and not NFM.

That is not the Scout, its the AR8000. The scout has no idea what type of modulation is being used. It simply says to the AR8000 "Tune to xxxx MHz". The mode the AR8000 is in depends on how you have configured it - it will be in the last mode you set, or if in "Auto" mode it will use the mode from the bandplan.

To solve your problem, make sure you have a correct bandplan and set your scanner to "Auto" mode.

: 3) Can REMOTE be reestablished without resetting the Scout if you take the
: AR8000 out of REMOTE?

Yes. The AR8000 will go into remote mode as soon as it receives a command from the scout. Therefore you can leave it scanning normally as you drive around and it will still reaction tune when the scout gets a hit.

Brian

Re-read your header... The wording make infers an illegal act by a
British company! Be careful next time.

Javiation, or ANY other UK company can, under UK laws, export radios
to the USA. Period! No ifs buts or ands!

It may be that YOU might be liable for local or state tax on YOUR
import. It may be that your state laws prohibit the importation of
certain types of radios.

THAT IS UP TO *YOU* TO MAKE SURE THAT *YOU* ARE NOT BREAKING THE LAWS
OF *YOUR* COUNTRY.

I think you owe Javiation, a reputable and well respected company, an
apology for the inference, accidental or not.

Donald Gray

That is certainly an eye-opener. I was at a location recently where most of the conversations SHOULD be confidential - the school prinicipal's office. I warned him (as a parent and police officer) that ANYTHING he talks about can be picked up as far as a 1/2 mile away. I guess it doesn't matter because we had this conversation 3 years ago, and he just got a NEW cordless phone for his office.

I wish he had a clue......

Tom,

The green wire, if grounded, disables the receiver. This may be used to tie into a transmitter's PTT wiring so the transmitted signal doesn't cause feedback, etc. on the scanner. This was a request of the CHP.

If you need the programming software, it is available on my Web site:

Agreed, the CE solves the problem very well. But there were times when I wasn't using the computer and my scanner serves me best sitting on the shelf, not on my desk.

I got around the long wire problem easily. I use ribbon cable. Using typical computer cable (I control all functions) proved useless. The ribbon cable allows me run a 4 foot length of cable w/o the scanner's CPU objecting.

I've used the setup for at least 4 yrs and have had no problems. But it would be best to stick w/a computer interface in most cases. Ribbon cable is readily available from All Electronics as well as most Electronic supply stores if you really want to try it.

If I find the MT w/the bi-lat switch mod, I'll post the issue date, it may have been back in '92 or further back.

I have tapped 2 of the 2026 scanners and I found that in order to get
a good enough signal for decoding I had to attach the ground wire to
the pin on the 3059 that is grounded to the circuit board (it is no.
18 if I remember - but just look on the back of the board to be sure).
A ground to the chassis WOULD NOT work on this scanner - too noisy!
I used a thin shielded cable and ran it to a phono plug that I
installed on the back panel. Be sure you don't cross the wires!!!

The MT article was in the August 1991 issue, pg 94, 95. You can buy the surface mount 4066 chips from RadioShack, they're used in the PRO-43 if I recall correctly. They were around $2.50 ea. 4 yrs back.

I think three things should happen, right away:

1. Everyone with a scanner should write to and/or call their
Congressional reps with the TRUTH.

2. The CTIA reps who testified should be sued by class action for
slanderous remarks made publicly about a large group of citizens.

3. The CTIA reps who testified should be prosecuted for perjuring
themselves before a Congressional committee. They LIED.

I purchased the V-tech one myself. It's a solid phone and the range is good. My only complaint is that the microphone in the handset uses a little too much noise-cancelling action. I guess if I had the schematic I could modify this! <G>
Cheers!

I didn't see that radio yet. The only one that I saw was the one in
their latest flyer for $179.95. I was shocked at that price. I thought
that these FRS radios were going to be mass produced and be very cheap.
I really don't think that families are going to race to Radio Shack to
buy two or more units at that price. I guess they will drop in price
after everybody gets them on the market.

Well, after a lesson in uudecoing documents, I finally got a .wav file to analyze.
Here is what's in those tones:
1st tone pair 784 + 501 Hz for 655 ms
silence for 200 ms
2nd tone pair 718 + 577 Hz for 283 ms

AND, attached, you can hear what they're supposed to sound like, minus room acoustics, distortion, and klaxton horn. This is a first generation, digitally synthesized tone sequence.

> hold a charge.

Well I'll jump in with both feet! ;-) There is no such thing as permanent memory effect in most Ni-Cd's. Agreeing with the above, just about all of the so-called memory complaints I have heard or seen can be attributed to other problems.

Ni-Cd memory is the most misdiagnosed problem. It is VERY rare IF it genuinely shows at all, it will only happen with repeated, identical discharge cycles. It is not permanent. If you seem to have a permanent capacity problem, it is likely something else that is wrong with the battery.

It doesn't do you any good to "fully discharge" your batteries before every charge cycle. Unless you are analyzing them which doesn't need to be done very often.

Most of what people describe today can be attributed to several "battery handling/care" problems such as...

1. Insufficent charging time. The light turning green on your charger doesn't always mean it's ready. This is almost always the case with rapid chargers - the "ready" light will come on when the battery is only 75-80% charged.

2. Long term overcharging. Esspecially if the charge current is higher than the "standard rate" (usually C/10). This is the biggest problem I have had with my cordless phone - the charger is brutal.

3. Changes in the duty cycle. True for cell phones and two-ways. If you talk more on the radio today than you did yesterday, the battery won't last as long. Cell phones automatically change power levels as well - yesterdays calls may have required only half the power as the calls you made today.

4. Charging at high temperatures. A ni-cad will not accept a full charge at high temperatures as it will a room temp. You should charge batteries when their internal temp is about 65 to 75 degrees F. Charging cold batteries can cause them to rupture or vent - especially on a fast charger. Vented cells will cause loss of capacity.

Temperature is probably the cause of many troubles with racing R/C cars, etc. The high powered ones will use the battery up quickly - fast discharging will make batteries warm. Then the users will fast charge them - that warms them up as well. Do that two or three times and you will see what you think is memory - but it's just that the battery is too hot to fully charge. (See #1 - Insufficeint charge time)

5. Deep discharge problems. A reversed cell will drop the capacity of a battery. But a cell that is only slightly reversed can often be brought back in line with a full charging cycle. This often looks like memory but it isn't.

As for anecdotes from me. The only problems I have had with ni-cd's I can attribute to over charging and physical damage.

My previous cordless phone (which had a kinder-gentler charging system than my new one) lasted six years and only needed one new battery during it's life.

I charge my cell phone battery every night "whether it needs it or not". It doesn't matter if I made any calls or not. I still get 15+ hours of standby time after months of this.

My old PRO-33 scanner has had the same ni-cds in it for over 5 years. It sits on a shelf not getting used for weeks... then stays on the charger for days while it's turned on... I still get 5+ hours out of it *depending on the duty cycle*.

My FT470 handheld 2m/70cm and Escort cordless both suffer from having batteries with vented cells. Caused by careless charging - not memory.

I also keep 160 ni-cd batteries maintained for emergecny response radios out of our office. We have problems with some - but NOT ONE problem can be called memory.

So there you have it. More anecdotes to counter the other ones. I deal with lots of batteries and spent lots of time reading literature about how to take care of them. My feeling: Most people don't know what ni-cd memory is.

Regards

Just call it in as a suspicious circumstance. You don't have to say you
heard it on a scanner.

661. C508A vs. WS-1000e

Newsgroup: rec.radio.scanner
Date: 1997-02-06 00:00:00 UTC
From: aa186@freenet.akron.oh.us
Message-ID: <E56pH8.FyB@freenet.akron.oh.us>
Source record: 208671

Can anyone compare or contrast the Standard c508a dual band ht with
800 Mhz receive and the Welz (Standard) WS-1000e scanner?

Are they about the same size?
Do the two units share similar scanner features?
Used prices on both units?
Sound quality comparison bet. the two? Which has the clearer, crisper audio?
Do rubber ducks signicantly improve receive performance on either unit?

In general I am wondering if the 508 is an acceptable alternative
to the WS1000 for someone who listens to HAMS and 800 Mhz.
Audio quality is especially important (more important than features).

Please reply to aa186@acorn.net

thanks
Mike

If you want a cellular-capable scanner, I would strongly suggest you get it now.

I was just watching Bob Grove on CNBC as well as the Senate taking up "Cellular Phone Privacy" on C-SPAN 2. Neither party wants any more "incidents" like the Gingrich call snafu, and tough new anti-monitoring legislation will be one of few things that they will be able to agree on this session.

"When owning a scanner becomes a crime, only criminals will have scanners."

>I watched part of the hearings...they're telling the FBI to "go after"
Bob
>Grove. It sounds like they want to make an example out of him.

One small problem...Bob Grove has done nothing illegal! There is NOTHING in the ECPA which makes the modification of scanners illegal, only the sale of cellular-capable scanners. Grove does NOT sell modified scanners; you must purchase the scanner, take delivery, and THEN send it back for modification.

Sorry, Senator Markey. You lose.

Have you ever landed on a channel filled with digital chatter and
wondered what you were listening to? We have the technology to
pick apart the audio spectrum of the incoming wave form and identify
the nature and encoding method of the signal. This is NOT 'decoding',
merely identification. Question is, the ECPA is so vague, its not
clear whether this is legal. Opinions anyone....

> Remember the President's Commission on Obscenity, championed by that tweeb-guy named Jesse "redneck" Helms....he read the report done by an independent organization about Obscenity being non-causative of any crimes of bodily kind...in other words, watching males strip naked by women does not turn women into rapists.

Jesse did not like the facts. he appointed another "official" tribunal to do research and bring forth their answers. And that is what they did. They contrived answers to fit their goals. They proceeded to make sex a crime if it was not as they saw it. They concocted answers to fit the Religious Right's answer to any subject sexual.

Then it became law that "indecent thoughts" are obscene. Lusting for sex became the onus for banning books if it incited lustful thoughts after reading. We became criminals for thinking "LUST-FULLY"....a major redefining a law that can put people in jail... for writing in a lustful way...with pictures...

Same oh, same oh with this new similar problem. But this time the Senators will rewrite the law to punish those who sell the machines so as to kill the problem which threatens their very security.

They will make a law to suit their goals. What is that?

Not being subject to being in their car and the public being able to listen in on what they say on cellular. They are in fear that people will still be able to "listen to what they really are considering as they talk"....

they will locate those who offer least resistance and put them out of business or in jail for threatening their "privacy"...

Seems the powers to be get to write the laws for which they set up the structure built to their needs...their goals....their fears ... their quirks.

Ain't democracy wunnerfull....full of power-brokers who live in fear of being found out.

Bill Conduit
etc.

676. Cellular Privacy Sub-Committee Meeting on CSPAN w/Bob Grove

Newsgroup: rec.radio.scanner
Date: 1997-02-06 00:00:00 UTC
From: kcc007@aol.com
Message-ID: <19970206163700.LAA07199@ladder01.news.aol.com>
Source record: 208686

Does anyone know about the Government Cellular Privacy Sub-Committee Meetings being broadcast on CSPAN. I friend of mine was surfing around and said he caught several hours of this very interesting discussion involving Bob Grove from Monitoring Times magazine and assorted others in the business and well as several government know-nothings that believe that "scanning" is appalling and immoral!

I would love to get a video tape or schedule on when these are broadcasted. If anyone has any info, please post it to the newsgroup or e-mail me.

I think all of us involved in this very interesting and educational/technical hobby owe it to ourselfs to know whats going on in our government on issues that affect scanning and radio reception in general.

Thanks

I don't know why you want to buy a "rubber duck" antenna, considering
it doesn't have much range, but you can buy one from Radio Shack, I
believe. Just tell them that you need a replacement antenna for your
handheld/base/moble scanner and make sure you get one that fits your
connecter(BNC for example).

Source record: 208696

Now, tell me this. PCS phones are supposed to be next to impossible to monitor due to digital systmes, right? Well, the man (don't remember who) who said that we are "electronic stalkers" put PCS in the same category as cell and cordless. Now, isn't that stretching the truth a bit? I think that they need to get their act together and at least know what they are talking about before they start making rules and telling subcommittees what should and should not be legal. This only opens the way for the the US Government to ban radios that can monitor police and government transmissions--and more. We will be in the same state as war-time Europe, operating under totalitarian rule. Sorry if I sound angry, but I am. We must not allow our government to say what we can and cannot listen to, what we can and cannot watch, and so on and so forth. Contact your reps and let them know how we feel. If there really are 10 million of us, then we have a real voice--let us use it.

If anyone would like to help draft a common letter to reps, then let me know, and we will start to work on it right away. I'll post it on my site so others can download it and send a copy to their congressmen. We must flood their offices with our opinions. We must let them know that censorship only leads to a great lack in confidence and trust in our government.

Please take an active role--we can keep our rights!

Totally disgusted,
Sonny J. Lewis

One thing I wish I had looked for was a model with a fairly wide based receiver so that it would stand up on a counter better without tipping over. We usually had to put something behind ours so that it wouldn't end up lying down with the 'speaker' pointed towards the ceiling or down into the table. Worked great as a 'clip on your belt' monitor, though...

Don't remember which brand we have, though. I *think* it's a Gerry. One of the lower-end monitors with the lights...

One thing we started to have problems with right before we packed it away, though, was the connection in the AC cord where it plugged into the receiver. Might have had something to do with the fact that we moved it all over the house probably a couple of times a day, and it got dropped off a counter or table about half a dozen times... ;-)

Karyl

p.s... We ended up doing the 'family bed' thing for the first 8 or 9 months, and still used the monitor *a lot* for nap time and in the evening hours when Aaron went to bed before we did. YMMV, of course!

WASHINGTON-

All it took was a minute, a 2-inch piece of wire and a soldering gun for Rep. Billy Tauzin to convert a legal radio scanner into one that picks up celluar phone calls.

Most experts agree it's illeagal to do this, but enforcement is difficult.

Tauzin, R-La., chairman of the House Commerce Committee's telecommunications subcommittee, who rigged the scanner at a hearing yesterday, is considering ways to toughen laws against altering listening equipment.

Celluar phone intercepts by scanner caught the public eye after a Florida couple using a police scanner taped a call among Republican leaders, one on a cell phone, discussing House Speaker Newt Gingrich's ethics case. Parts of the tape were subsequently printed in the New York Times.

Of 10 million leagl scanners sold in the Unites States, it's estimated that a "few hundread thousand" have been modified to pick up celluar frequencies, testified Bob Grove, whose Noth Carolina company offers alteration services.

New digital celluar technology is supposed to make such eavesdropping more difficult.

Tauzin, standing at one side of the large hearing room, usaed an off-the-shelf police scanner he altered to pick up a conversation between two willing participants, Rep. Edward Markey, D-Mass., on a celluar phone and Rep. Anna Eshoo, D-Calif., on a regular phone.

Eshoo was at the opposite end of the room and Markey was between them. Suddenly, static could be heard from the speaker on Tauzin's scanner, then a crackly but decipherible pickup of the conversation.

Grove insist he operates within the bounds of the law. Markey, who wrote a 1992 law designed to protect celluar caller's privacy, disagreed.

"it's illegal to modify," Markey declared, vowing to rewrite the law clearly to block the sale of modified devices.

Information to turn police scanners into celluar scanners is available on the Internet and in some magazines, Tauzin said.

"The law and it's enforcement have been inadequate," testified Thomas Wheeler, president of the Celluar Telecommunications Industry Association, representing celluar companies.

689. Tauzin says "Electronic Stalking"

National Public Radio did a 3 minute piece this morning where they had a Cellular Telephone Association representative
modify a 'just bought' scanner and then Rep Billy Tauzin demonstrated it intercepting a cell phone call in his Capitol Meeting Room.

The NPR reporter made the remark that "most people do not know how easy it is to have their calls tapped this way."

They interviewed another "expert" who saidsomething to the effect, "this is technological war, and as soon as they come up
with a fix, the scanner techno's come out with a counter."

Rep. Billy Tauzin (La) then allegedly said, "We may need new laws to stop this 'Electronic Stalking'."

This isn't funny anymore. What if anything can we do to stop these morons from making it illegal to turn on our scanners? I really don't think writing to my congressman is going to do squat. I guess our only saving grace if we do get caught is that the Martins haven't been prosecuted. (I wonder why?) I guess I'll just keep my scanner in my home and listen there. I'm not even sure about listening in my car anymore. Well, if they're going to come to my house and get my scanner, they're going to have to face down my guns first just to get to it. You think they would have dangerous criminals to go after instead of us scanner junkies.
Tyler

PS: I guess they couldn't figure out how to censor the internet, so they will go after us poor chaps now.

You should also be ashamed of yourself. It is the few idiots like you that
should not even be allowed to own scanners and are making the government
pass more and more stupid laws limiting scanning because of what a couple
idiots with scanners and a third grade education are doing.

I've abused my antenna jack on my BC100XLT for quite some time now and I need to replace it. (Non-flexible antennas, constant switching of cables, etc.)

Anyone done this before? If so, any gotcha's? It looks pretty straight forward.

Should I send it to Uniden?

Where can I get a new BNC jack from?

Thanks for any help.

With my daugther I had a middle of the line costing monitor that
didn't last 6 months and it had so much static in it always. 8
years later when I had my son, I bought the cheapest one I could
find $22) and he is almost 2 and it is still working fine. I
could hear him out in the yard when I took it, and sometimes I
could hear the folks across the street on thier phone (elderly couple)!

AOR 3000A-PRICE REDUCED!!!

Nice all mode (AM, LSB, USB, CW, NFM, WFM) receiver covers 100 khz through 2036 mhz (cellular blocked). 400 channel scanning capacity, 50 channel per second scan and search as well. Other features include VFO tuning, 13 band pass filters, user selectable tuning rates from 50 hz through 999.95 khz, LCD clock and digital s-meter, just to name just a few. This unit has an RS-232 port for optional computer control (with the appropriate software). Includes original box, manual, power supply, whip antenna, and dc plug. I am a non-smoker and the unit is in excellent condition.

Asking $775.00 and I will ship this to your door anywhere in the continuous United States.

Thanks for reading this.

> highly recommend it. Bo

The Escort Courier 9600 is a good performing phone (the radio part). It is a direct sequence spread spectrum phone - that's two layers of digital encoding offering inherent encryption.

I have one and there a couple of things I don't like about it. The handset receive level is little low. The base unit overcharges the batteries - if you are not careful about this your batteries won't last.

There is a good argument that supports freq hopping SS over direct sequence SS when you consider "jamming immunity" (avoiding interference). But in reality (just my experience with my room mate's AT&T freq hopper and my Ricochet modem) both have about the same limitations.

Go spread spectrum. Be careful about buying just a "digital" 900 MHz phone. While almost all of the 900 phones are digital, many are still narrow band, channelized radios which are still pretty secure but don't have range of a spread spectrum phone. SS phones will almost always list "Spread Spectrum" as a major feature.

I bought a Pro-51 right when they came out. I remember that a keypad "trick" was posted to this newsgroup way back then (late summer '94). The trick allowed scanning into the cellular bands - and it worked on my scanner. I have since forgotten this "trick" and have accidentally erased my copy of the file that told of it. Could someone please post it again.

Thank you so very much,

Maria Rightley

>Mark

Mark,
Although for the most part I agree with your attitudes about media and
others listening to police broadcasts, I for one really like to listen
in to whats happening. Unlike some, I don't chase or try to offer
the police assistance by telling them "he went EAST!".

I thought it worth the mentioning though, that MDT systems are FAR
from foolproof. I regularily listen to the MDT system that my local
police use here. It shows detailed info on some people and their
e-mail as well. It would seem that the police were duped when sold
their system. I am sure they were told it was secure, when in fact it
is not. There is no incredible mystery to decoding this info! It is
NOT encrypted and can be decoded given an average scanner and a PC to
decode the data on. Try not to rely to much on your MDT system giving
you secrecy or privacy .... as usual, somebody is happily watching.

Source record: 208711

Hi,

I was looking to buy either a pro-26 or a bc3000xlt, and I know the general consensus is that the bc is an overall better radio, however I have one question: whereas the pro-26 has 25-1300mhz (minus cellular) coverage, there is a gap in the bc3000 between 550-760. What goes on in these missing frequencies? Is it worth buying the pro just because it includes these frequencies; would I be missing out if I got the bc3000?

Thanks.

> A little knowledge is a dangerous thing......

You guys are blowing this way out of proportion. Last I heard, the constitution was still in effect. Any laws they pass regarding this are going to be just about as enforcible as the so - called "listening ban". There are not going to be any bans on electronic parts. First they would have to PROVE that I am using them to build a converter, then they would need a search warrant to even come into my house ! They are going to have a little trouble with the "proof" part, since I am and have been a ham radio operator and electronics hobbyist for some 30 years. Don`t let your paranoia run away with you yet.
Years ago, the cell industry promised these people privacy. They have failed to live up to that promise, and I think the Congress is about to MAKE them live up to it. So if they digitize or scramble the phones, who cares ? Lots of scannists managed to live before there were cell phones, and if they can`t listen to them any more, then it`s not the end of the world!
These hearings can only accomplish one thing : They prove, once and for all, that the ridiculous "listening ban" DOES NOT WORK AND CANNOT BE ENFORCED. So they are going to have to attack the problem from the other end, and make the cell companies provide some security for their users. What makes you think that they can engage in the kind of "police state" tactics that you are describing and get away with it? They would literally have to scrap the unreasonable search and seizure clauses in the constitution to do so!
And as far as I know, there are millions of ham radio operators out there with plenty of parts in their more - than - ample junk boxes to build a converter without ever ordering a single part.
What this kind of legislation WILL do is create an extremely lucrative black market in converters, and in PARTS to BUILD converters !
And what are they going to do, ban every radio that can recieve an image frequency ? I think that would be quite an extensive list, even if you could

LOCATE every one of those radios ! Not to mention the millions and millions of man - hours and dollars it would take to CONFISCATE those radios ! In case you are not familiar, you are talking the kind of paranoia that exists in totalitarian countries, where anyone with a radio is suspect ..... This IS still the UNITED STATES. How do you think it would look to these countries, if we were to implement such a police state ? They would tear us to shreds in the propoganda department. We would look like (and BE) the biggest assholes on the planet Earth, after preaching "democracy" for a couple hundred years ! They would LITERALLY have a field day ! So come out from under the bed, and keep your paranoia in check for a bit.... It isn`t going to happen.

It was doing that earlier too... If you had clicked on the Options/Stats
option in the real audio player, you might have seen about 33% lost
packets... I know I did.... UNTIL, I switched over from UDP to TCP-IP
in the preferences setting.

Must have been a heavy overload (due to the Simpson verdict that evening?)
on policescanner.com on Tuesday. Normally I only see 0-5% lost packets.

I just purcahsed the newest addiotin to the Family Radio Service Family.

The RS FRS-108 Catalog Number 21-1808 Sells for $129.99

This radio has all 14 FRS frequencies, andcan scan all 14 channels. This Radio does NOT have CTCSS tones.

I had my scanner hooked up and taping while i bought the radio. I heard myself about a mile away while in my car.

After I got home, I noticed a conversation..... seems a couple people have decided to act stupid on the radio....

YES.... the *very first* radio traffic i ever heard on FRS was a couple idiots. Received signal was loud and clear The people refused to give me their location. At any rate.... those on rec.radio.cb would call these people Inbred Operators :)

This radio has a power output of 300 mW ERP, less than the maximum legal power.

The radio requires 3 AA cells, and they do not recommend NiCads. Battery life is rated at 120 hours.

The ABC case may be more involved then it appears. I saw a report that during
the trial the raw footage was shown to the jury, not the cut, manipulated

stuff they put out on broadcast. In that raw footage, the undercover reporter was filmed damaging equipment and encouraging employees to cause health violations. This is far, far different then passivly recording violations.

> I have
modified a Pro-43. My brother has a Pro-39
>which looks similar. The diode
configuration is different
>though. Can this be modded?

It sure can. I
bought a Pro-39 whilst in the US and got back to the UK
to find th
at the bands were different here. So after reading about the
various mods
applied to other scanners I bit the bullet and took mine
apart (I couldn't
find any notes on any of the FTP servers for the

Pro-39, so I wasn't
expecting to be able to do too much). As it
happens, the mo
d was pretty much identical to those carried out on other
'Pro' scanners; only
the names have changed.

I did the 800MHz mod by removing one diode, the
third in the line of
four (I think the diodes were D4-D7 and the diode to
remove was D6 ---
but don't quote me on that) and that range n
ow works for me. I expect
if I'd tried the other diode mod, that too would
work but I didn't.

The only real difference I found from the other mods was
that I didn't
need to remove the keyboard PCB, just the shield. One other
thing, the
diodes are surface mount, so they're small an
d you'll need a
small-tipped iron (well mine wasn't but it would make it a
LOT easier).

Sorry this is so vague, it was a while ago and I've
forgotten the
details. But the answer's a definite YES. Read up on the
other mods
for dismantling details.

and thought I would pos
t/repost here since I have seen several requests
for the PRO-39 Mods.

CUT HERE -----

*** Bob's Tip of the Month ***

(from
Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few co
mments added by someone who witnessed such restoration -jqt]

The
recently released PRO-39 handheld scanner from Realistic (R)
is a fine
performer, but its 800 MHz range is interrupted by the
factory censoring of
cellular frequency coverage. Long-time MT
supporter Larry Wi
land of Youngstown, Ohio, would like to share the
simple fix. Remember,
however, that it is unlawful to listen to
cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt
them unless
you are familiar with small component soldering.

Monitoring Ti
mes accepts no responsibility for damages resulting from
attempting this
modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering
wick,
small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is
ON can
erase the memory! -jqt] Remove the battery door, holder and
[battery
pack] from the bottom of the radio.

(2) Remove the four screws
from the back of the scanner and carefully lift
the back off.

(3) Unplug
the two wiring harnesses at their connectors and remove the six

bright colored screws [that hold] the circuit board in place. Unsolder

the ground wire from the lower right corner of the circuit board.
Unsolder
the two wire connections from the BNC antenna connector at the
board.
Carefully lift the board (grasping it near the Molex connector)

and set it aside.

(4) Remove the two bright colored screws from the next
circuit board.
Carefully unplug the two-wire connector [and remove the
board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield
exposing
the diodes.

(5) Carefully unsolder and remove di
ode D6 only; this will restore the
missing cellular frequencies which can
be searched in appropriate
30 kHz steps.

This completes the
cellular restoration. Reverse all procedures
to reassemble the radio and
test it by entering any frequency between
869-894 MHz. [If
you are as lucky as I was, the memory will still
contain your other

frequencies! -jqt]

Curious about the other diodes? D4 would enable
68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz
band
operation; and D7 would make cellular spacing 12.5 kHz (inco
rrect).

Thanks Larry!

>available, and it runs 50% faster than before - Making it run great on
>most 486 machines! Here are some of the features that are available :

Hello netizens,

In the past, I have evaluated and even purchased shareware S/W that
claimed to decode DTMF tones reliably (I won't mention the name of
this S/W but I just wasted about 50$...:-)
I was deeply dissaponted by it's unreliable performance, both the
real-time version as well as the off-line processing version (from a
WAV file). It was simply TOO SENSITIVE to sound level and source (for
example, my voice modem easily decodes DTMF tones RELIABLY while this
s/w refused to decode tones from my cellular phone (I called home and
monitored the tones on the line). It did decode tones off my landline
phone, but as mentioned, not so reliably).
Can anyone comment on the reliability of decoding of this WINTONE
program or any other available? Are the H/W devices more reliable?

Thank's for any help offered.

When responding, please email directly in addition to posting
here, since our news server isn't very up to date. Please note
that you must edit the reply email address (remove the .NOSPAM
postfix). This has been done in an attempt to reduce the amount
of junk mail received here from automatic mailers. Thank you.

regards,
techno

The justice department has stated (if my info is correct) that they would not enforce this law unless their were some unusuall circumstances involved. Like making some kind of financial gain, for instance.

>However, the main thrust of the law was to add a degree of
>punishment for those who listen and then tell what they heard.

Not true. The cell phone industry bought the law (literally) so that they could lie to their customers about the "privacy" of cell phones. I followed the progress of the law in the '80s. It was one of the most blatently disgusting things I've ever seen in government. You wouldn't believe the contributions the cell phone industry association made to elected officials to get this passed.

On the other hand, couldn't separate digital decoders be produced independent of the scanner? I've been wondering if I couldn't piece together a dsp (Analog devices makes some REAL fast dsp's that don't cost a lot), codec, and support circuitry to make one myself. Connect it to the IF output and you should have it. Right? Or can somebody blow a hole in this notion? The biggest obstacle seems to be software but where theres a will, there's a way.

Date: 1997-02-06 00:00:00 UTC
From: rsted@ix.netcom.com
Message-ID: <5dbh0q$gf2@dfw-ixnews4.ix.netcom.com>
Source record: 208732

I have the following scanner magazines for sale. All are in excellent condition as received in the mail, and they have been carefully stored. I will be moving in a few weeks and am forced to sell them ASAP.

1. RCMA original "Newsletter" & "Scanner Journal" COMPLETE*! From first issue of Sept. 1975 until last issue of June 1996. *Well, almost complete - am missing October 1986 for some reason. Also Sept 75 through Dec 79 are reprints in a binder as was available from RCMA. This is almost 21 years and over 240 issues. Truly priceless, but am asking $175.00 (includes UPS shipping)

2. MONITORING TIMES - ENTIRE run from first issue of Jan 1982 until December 1996. About 180 issues. First few years were newspaper format. Asking $150.00 (including UPS).

3. North East Scanning News (NESN) - ENTIRE run from October 1985 until August 1994. New England & Mid-Atlantic states coverage. Over 100 issues. Will include with these 37 issues of AOSC "American Scannergram" from Jan 1987 through Jan 1993. Asking $125.00 for all (including UPS)

4. POPULAR COMMUNICATIONS - ENTIRE run from first issue of Sept 1982 until February 1994. Over 130 issues. Includes 6 custom PC "library binders". Asking $125.00 (including UPS)

If someone wants ALL of these, I am prepared to be *VERY* flexible with the price! Just imagine, it would take several years just to read through all these, after which you will definitely be a scanner expert.

Seriously, this is a rare opportunity for someone new to the hobby. Please email me if interested.

Thanks,
Dick Stedman

Well, they're at it again...since Newt's cell phone conversation was intercepted, Rep. Billy Tauzin of Louisiana has taken up the fight to make cellular monitoring a crime. Check this story on CNN's website:

http://cnn.com/US/9702/05/cellular.eavesdropping.ap/index.html

Tauzin evidently modified a scanner with a piece of wire and soldering iron. (Question: How many congressmen does it take to unblock a scanner?) The good news: Bob Grove was there to testify. The Bad News: they didn't listen, as is obvious from this quote:

"It is time for the electronic stalkers ... to stop thumbing their nose at the Congress and trampling on individuals' rights,"

What a crock! Can they ever understand that even *they* can't change the laws of physics?

I am new to the scanners, and have some questions on the Bearcat BCT-7 dated OAIF.

It has 'capabilities' from 29 - 956 but it will jump over some freq. in 0.050 steps. Can this be changed?

In the 806 - 956 it jumps over a hole segment of freq.(I assume :} cellphones) Can this be changed?

I am listening to police, state patrol, and a smaller airport close to work. I have noticed people posting info about the spaceshuttle. Can I get this in Atlanta? What freq? I guess I might need a real antenna.

Thank you in advance, I do apreciate the info you all post to help us new people out.

I would take a guess and say that the problem is probably the actual switch
inside the radio, since the three button switches on the FT-50R (10R etc)
have a tendancy to go bad and require replacing.
I've done the cel mod to my radio and have had no problems, however over
time I have had my LAMP button and my PTT button go bad, thus need
replacing the switch inside.

Have fun.

BC860 should be 10.85 MHz. That means for
example, on VHF High band 140 - 174 MHz, you will pick up images
21.7(10.85 x 2) MHz DOWN from what you have programmed in for a given
frequency. The same applies to UHF band and 800 MHz. That's why Cellular
can be picked up for axample, from 894 - 915.7 MHz in a scanner like
yours. The Cell band is actually in the 869.04 - 893.97 MHz range, which
is blocked from be programmed into your radio. Tripple conversion
receivers typically, do better at "rejecting" or filtering out images
because their 1st IFs are of a much higher frequency 300 - 600 MHz
typically, which places a much wider separation between the intended
receive frequency and that of any possible images. Commercial grade
receivers do much better at blocking out images because they usually use
RF signal input filters that are much more selective or narrower in the
range of frequencies that they permit in.

A couple of drawbacks in receiving Cellular via images, with a scanner
that uses a 10 MHz IF, is that if you calculate out the numbers, where

894 MHz is the lowest freq that you can program in, where the image will land you in the Cell band: 894 - 21.7 = 872.3 MHz, you see that there is a range of over 3 MHz that you will not be able to receive. Further more, with a scanner like an old BC760 for example, that could be restored to Cellular programming. When you had a frequency of say, 892 MHz programmed in, you would never really know if what you were hearing was a signal on 892 OR 870.3 MHz(it's image).... The other major drawback in both cases, is that you are limited to tuning frequency steps of 12.5 KHz. Cellular is spaced at 30 KHz. This means signals on some channels would be received a couple of KHz off frequency.
Have fun

More bullshit. The cellular companies should tell their
customers that their phone calls are being listened to. The cellular
companies should spend the money to make their transmission secure.
Most any scanner today can pick up a cellular converstation on
another frequency know as an image,etc. So one does not have to have
cellular modified scanner to listen. It is inherit of all scanners to
be able to do this.
The mega buck cellular companies have some stiff competition
now from digital mobility services. They remind me of america online.
They need to keep up with the jones and update their equipment!

On Wed, 5 Feb 1997 20:04:13 GMT, brucem@eskimo.com (Bruce Miller)
wrote:

Tauzin: Toughen Eavesdropping Law

By JEANNINE AVERSA
Associated Press Writer
WASHINGTON (AP) -- All it took was a minute, a two-inch piece of
wire and a soldering gun for Rep. Billy Tauzin to convert a legal
radio scanner into one that picks up cellular phone calls.
Most experts agree it's illegal to do this but enforcement is
difficult.
Tauzin, R-La., chairman of the House Commerce Committee's
telecommunications subcommittee, who rigged the scanner at a
hearing Wednesday, is considering legislation to toughen laws
against altering listening equipment.
Cellular telephone intercepts by scanner caught the public eye
after a Florida couple using a police scanner taped a conference
call among Republican leaders, one on a cell phone, discussing
House Speaker Newt Gingrich's ethics case. Parts of the tape were
subsequently printed in The New York Times.
Of 10 million legal scanners sold in the United States, it's
estimated that a ``few hundred thousand'' have been modified to
pick up cellular frequencies, testified Bob Grove, whose North
Carolina company offers such alteration services. New digital
cellular technology is supposed to make such eavesdropping more
difficult.
Tauzin used the off-the-shelf police scanner he altered to pick
up a conversation between willing participants, Rep. Edward Markey,
D-Mass., on a cellular phone and Rep. Anna Eshoo, D-Calif., on a
regular phone.
Grove insists he operates within the bounds of the law. Markey,
who wrote a 1992 law designed to protect cellular callers' privacy,

disagreed.
``It's illegal to modify,'' Markey declared, vowing to rewrite the law to clearly block the sale of modified devices.
Markey's law, which took effect in 1994, made illegal the import, manufacture and sale in the United States of scanners that work on cellular frequencies. It also required that new scanners cannot be ``readily altered'' to pick up cellular calls.
Information to turn police scanners into cellular scanners is available on the Internet and in some magazines, Tauzin said.
``The law and its enforcement have been inadequate,'' testified Thomas Wheeler, president of the Cellular Telecommunications Industry Association, representing cellular companies.
Wheeler, who helped Tauzin demonstrate how easily legal scanners can be modified, asked for tougher laws to cover new technologies.
``It is time for the electronic stalkers ... to stop thumbing their nose at the Congress and trampling on individuals' rights,'' he said.
``There are laws on the books protecting the privacy of these calls,'' Tauzin said, ``but apparently they may not be working the way Congress intended,''
In an interview with The Associated Press, Grove said his company, Grove Enterprises Inc., operates legally because it neither sells nor markets altered scanners.
``There is no caveat, no direct prohibition against modifying those scanners,'' Grove said.
While those precise words are not used in the law or regulations, communications attorneys say companies or individuals that modify scanners to pick up cellular signals are violating federal provisions.
In general, it violates federal law to intercept a cellular telephone conversation and pass on the contents to another party. The exceptions: when police obtain court orders to use wiretaps in monitoring suspected criminals and when one party to a conversation has given permission. Many states don't allow eavesdropping based on such consent agreements.

> little radio and feel imprtant.

Heh-heh, relax my friend. This is a complex and new argument and I will at times contradict and recant some of my points if and when necessary. Best just to go along with it without getting all excited. The goal is right, but I would be a fool not to consider the viewpoints of people like you and other critics. If I want to get anywhere, I'm not afraid to compromise in order to do so.

Still, I do not see much of a contradiction in this case. Access to live police broadcasts is hardly a right. I described it as an "accidental" evolved quasi-right in that people have gotten used to listening by taking advantage of the low-tech and relative disconcern by police up until now for them to do so. Still, no police agency has an obligation whatsoever to maintain live access. That doesn't mean, though, that they shouldn't. As you can see by some of the other posts around here, there is some concern over criminal advantage via open broadcasting, crowd control problems, privacy issues, etc. My point is to overcome the validness of these concerns by stressing the benefits of open broadcasting in terms of community support, trust, and in the proactive model, utlity benefits.

I've also been careful to stress over and over that police are going to win the control issue of open broadcasting because technology will reduce voice communications to an insignficant level before long; or it will become 100% digital. If I argue that we all have a right to listen to police calls with police scanners, I could win that argument but have nothing left to scan! That's why much of this has little to do with access to live communications after a certain point, and everything to do with police-controlled proactive communication with the public. Maybe this is what has you irked, but I can see little to do about it short of including arguments that we have access to MDT communications, digital map readouts of patrol car locations, and dashboard cameras. All that would be nice, but I don't think we'd get that. Maybe another activist could - I dunno.

Ideally, we'll ALL be left feeling important in the proactive communication model of the world. Cablecasted information directly into the homes of citizen residents would allow everyone, not just me, to feel like an important accessory in the fight against crime. There's no question new controls and new mechanisms would have to be put in place,

but it's the right philosophy. For now, police scanners are the ideal solution. They meet the proactive communication standards while at the same time imposing little on police agencies. As long as there is voice communication, we should have the same right (not that we have been *guaranteed* it), to access that information as long as the organized media does. When voice communications dry up, it will for everyone - not just the public. To turn that around: Whatever the police can provide to the media, they can provide to everyone. Today's technology allows that.

As for failing to respond, I thought I did post a reply to these groups. It's possible I didn't. I might have been leery about responding to your post personally because of the "me@me.com" address, which is likely not valid. A Dejanews search, for example, shows posts under that address in sex.incest.com, and others. In fact, there are 828 posting under that address in all kinds of newsgroups - all of which seem antagonistic and argumentative! So, if I didn't respond personally (and I think I did now that I think about it, as an effort of gesture anyway), it's probably because I doubted the recipient was "for real".

I don't know if you are for real, but I enjoy your criticisms and look forward to more of your concerns. :)

Dave

Les Wilson <nessman@servtech.com> asked:
> ... a list of the color dots and their corresponding frequencies ...

From the FAF - Frequently Asked Frequencies
on CompuServe - Hamnet as FAF.TXT

Dot Frequencies

Dot color Other
Red 151.625 itinerant "J" Dot 467.7625
Purple 151.955 "K" Dot 467.8125
Blue 154.570 Silver Star 467.850
Green 154.600 Gold Star 467.875
White 462.575 GMRS Red Star 467.900
Black 462.625 GMRS Blue Star 467.925
Orange 462.675 GMRS
Brown 464.500 itinerant
Yellow 464.550 itinerant

"Dot" stickers are used by the manufacturer or distributer to
indicate the frequency of otherwise identical transceivers. They
are often found in rental inventories and on construction sites.
Additional itinerant frequencies include 27.49, 35.04, 43.04,
151.505, 158.400, 469.500 and 469.550 MHz.

Because the amount of "sidetone" on the system varies from call to call
and between different makes of mobile..

> I have programmed my
>entire bc200xlt with two way conversations after sampling frequencies
>that had two conversations before doing so.

Just pure chance...

> Later, that same
>frequency can turn up being used for only one conversation. I have
>concluded the frequencies do both single and dual conversations, and
>you cannot predict when a given frequency will be used for which.

There is no distinction in the system between "single" conversations and
"dual" conversations, it is simply that in most cases when the Base Tx
sends the audio *from* the phone line, there is audio from the mobile tx
as a result of the "sidetone" characteristics of that particular
circuit. As a result you can hear some audio which is mormally sent from
the mobile *to* the phone line... So then you hear both sides of the
conversation. In other cases the sidetone is a lot less or not there at
all (often one party is using a handsfree adapter on their mobile...) in
which case you only hear one side of the conversation...

> If
>someone has a better explanation than that, I would like to hear it.

I hope I explained it properly...

Regards...

Isaac Bentley <painting@c-zone.net> wrote in article
<01bc0f67$9797fe20$6516d3cf@painting>...
Hello!!! Anyone there? Their is NO MEMORY EFFECT!!! It is a MYTH and it
should die as a MYTH. Yes there are proper ways of charging nicads and also
there are wrong ways like discharging them ALL the way down because it
might short out a cell.

Isaac Bentley KD6TCV
painting@c-zone.net

Another hobby of mine besides scanner radios is also racing Electric
Radio Controlled Race cars (no, not Radio Shack cars) and we also use Nicad
batteries for powering our models. I have read many articles concerning
battery care and read literature from battery distributors dealing with
this subject and they will tell you that THERE IS A MEMORY EFFECT..... I
have seen this happen to my batteries as well.....
In radio controlled modeling, the quickest way to turn a battery pack
into junk is to not discharge it completely after running the
pack......after awhile, the battery pack will not have enough capacity to
be any good..... but you do have to be careful and not over discharge the
battery pack as the cells will either short out or the polarity will
reverse..... (we use the Sanyo SCRC 1700 mah sub-C cells)
Most people connect light bulbs to the packs to discharge them but you
have to be careful and not let the pack discharge to the point where the
light goes completely out.......because a pack is only as good as its
weakest cell and usually that weak cell will discharge first and then will
be reverse charged by the other stronger cells...

From misc.emerg.services:

** BEGIN FORWARDED MESSAGE **

I'm testing out the Real-Audio server.

I've hooked my scanner up to the audio encoder, and am running a
RealAudio server <http://www.realaudio.com> from that output.

If you would like to listen to,

Wake County Dispatch
Wake County "Channel Two"
Cary Dispatch (VHF)
Raleigh Fire
Wake County "RESCOM"

aim your browser to:

<http://www.middlecreek.org/fairview>

and select the "Wake County Radio Traffic" link.

Feel free to browse the other things that are there as well..

NOTE 1: There is not a *LOT* of traffic on the given frequencies,
so you will get quite a bit of silence.

NOTE 2: This is a 30-day trial version of the RealAudio server, so
let me know if you think it is worth keeping around.

You will have to use a decoded to create a ????.wav (???? = whatever the name is) Then place the
wav in the area you intend to use it. Thats it.

Check PTT Lock function. Also, try CPU reset, and remember, a LOW
battery may make rig receive normally, but not transmit.

Good Luck!

Tony,
Buy mail order and you can get it for the sale price($350)
delivered to your door. Try Pioneer Data in Oregon at 800-
930-5115...they are a regular Radio Shack store with a mail
order business on the side allowing them to sell for less.
Bought my 26 and 2042($380) from them. Good luck!

Your best bet would be to get reprints of reviews
done by Bob Parnass for Monitoring Times magazine.
Personal opinion would be to buy the UBC3000 as
long as you can take the large size and ni-cad
battery. It has great audio, good image and intermod
rejection, 400 channels, wide coverage and a nice
set of features(auto-store, search lockout, etc.)
Good luck!

: improve audio volume and control? Thank you in advance.

i would have to imagine that it's your sound settings. i believe
if you turn your input level to a higher state on your sound card
that it would come out much louder. i do it using my pro-51
with the input line volume turned all the way up and it comes
out just fine. well, i say just fine, it IS slightly lower than
other line input devices that i have hooked up. guess this is
just the nature of the scanner output jack. if you have the
volume on the scanner all the way up and the line input volume
all the way up and it's still too low, i guess the only thing
you can do is boost what little volume you have either through
some sort of amplifier between the scanner and the card (be careful
here, you can screw it up if you arent careful) or through software.
if you go the software route, what you'd want to do is record
it with the low volume like you have it, bring it in to a wave
mixer (i use both voyetra's and sound blaster's) and boost it
from there. this isnt the best route to go, because you will
lose some quality (all you're boosting is volume, not clarity),
but it could be all you have.

good luck

Hi All,

Looking to buy one of the new 900 Mhz cordless phones. Any
comments welcome in answing my questions below.

1. 'Best' Manufacture? ie. Sony, Uniden, _, _,
2. Range in feet around the house, outside?
3. Are they "Spread Specturm", frequency hopping? More private?
4. Cost and where to obtain, K-Mart, Wal-Mart _, _,

Thanks in advance for any information.

:-) Greg

I dunno, really. I'm not so much into the technical side of
solutions. It seems to me that if it were possible to decode digital
radio communications, we'd at *least* be hearing about up and coming
scanners capable of doing so.

But even so. I just don't think chasing the police down with
technology is the answer. They'll have access to better evasive
technology than ever before in the upcoming years, so why count on
scanner manufacturers to solve the problem for us? Let's work on
changing police attitudes about open broadcasting and proactive
broadcasting solutions instead.

Let me know if you can do it, tho! :)

If you are using any Motorola Radios for Monitoring such as the
Maxtrac Maxtrac LS Radius Spectra etc.. I designed a circuit that gets
rid of the buzzing and beeping for these radios.

G/Wiz is another product on the market that will also get rid of the
buzzing and beeping on most scanners.

Email me if your interested...

I purchased one of these as my first outdoor scanner antenna about a year ago and haven't been disappointed at all. The construction isn't the highest quality in the world with the hollow steel, and it tends to wiggle a bit in the slightest breeze, but I have NO complaints on reception.

Of course, I don't have much to compare it with either.

I also hear that Comet makes a good antenna.

Hello,

Just 90 minutes ago I heard sirens. I turned on my scanners (all 4
of them) and heard the fire department describing my house. I looked
out the front window and saw trucks gathering. Realizing they were at
the wrong place, I ran outside to inform them that they were at the
wrong place, and therefore saved them from exiting the vehicles as they
would have if I had not been listening.

By doing that I saved them about two minutes worth of unloading &
reloading equipment. I then called the BUSINESS LINE of Emergency
Control which responders use (an uninformed idiot as you describe would
not know that number & tie up emergency lines) and informed them of the
situation. I was given the name of the calling party and provided
proper directions for responding units.

As it turns out, one of my neighbors down the road was lying on the
floor of a heart attack. I suppose you think that three minutes doesn't
count when your not breathing. I could give you the family's address
and you could try to convince them of your theory if you like.

And now for my analysis of YOU. I believe that your one of those
cops who brags about beating someone like Rodney King (P.S., I'm white),
and then gets mad because someone like me was listening and recorded it
for your trial. You wish all listeners would go away, you think police
are Gods and you probably spend your days bragging, "I can do that, I'm
a cop".

Your the kind of cop I like to go to trial with because you don't know a thing. Most of your cases get thrown out because you thought you could pull over someone because he 'looked suspicious'. You probably can't define suspicious. Your the guy who joined the department so you could put a pretty light on your dashboard.

Before I go I would like to remind you that without the public, police would never solve a crime. After all, we provide most of the evidence in an effort to assist. The 'Good Citizen' (or 'idiot' as you see them). One word of advice, pull your head out of your ass and you may see the light.

Until then, get over your God complex. I am not alone. As long as there are people like you, there will be people like me to make sure you don't get out of line. Your a cop, and you still work for me!

There is a pizza shop close to our local state police barracks and
often the troopers in the barracks will get togather and phone in an
order and then call on the radio to have someone pick it up. In my
younger day when I was mischievous I would call the pizza place and
modify the order. I still wonder what they did with all those
anchovie pizzas.

I say without reservation, that this is the best hand held scanner that I have ever owned. Great sensitivity, great selectivity, PL, DPL, 200 channels, 10 banks, nice display, uses regular AA batteries.

The only faults that I found are relatively minor.

1) It won't search for tone.

2) There's no way to keep the display light on for more than three seconds.

3) No way to turn off the beep.

4) The external speaker jack should be on the top of the radio, not the side.

Other than that, I love the thing. Better than the Regency HX series, much better than any of the Uniden Bearcat scanners.

If the cellular industry is so bent on insuring privacy, then they need to invest in some sort of digital system that is more difficult to intercept, instead of relying on legislation.

As far as rights go, how about my rights? If my body is forced to absorb these electromagnetic signals, then I should have a right to decode them so I know who is bombarding my body with this radiation.

I kinow this is totally useless, but does anyone have e-mail addresses for Representatives Tauzin (R-LA) and Markey (D-MA). These guys are very dangerous.

Bill,

Dallas Police Signal Code 17 is a gang fight. Signal Code 45 is a tactical call out. There are no codes 46 through 50.

Since you seem to like monitoring the scanner, let me provide you with some information you might like to know:

I am the Assignment Editor for a local TV station, and I have 14 scanners on my desk.

Scanners number 1 through 6 are leased to us by the cities they monitor. They are actual police radios taken from police cars, and they monitor the trunked talk groups used by those cities. (This is to comply with court orders about the freedom of the press, the need for the media to be able to monitor the police and the difficulty following trunked communications, blah blah blah. Bottom line, you would not be able to lease a radio and even if you could, it's pretty expensive.)

Scanner number 7 is an actual Motorola two-way taken out of a Dallas police car. (They even gave us the microphone, so theoretically, we could transmit. But don't worry, we have resisted the temptation so far.) It monitors 16 frequencies. Channels 1 through 12 are Dallas Police Channels 1 through 12. Channel 13 is the Dallas Fire Department's Engine Response Frequency. Channel 14 is Biotel's MED-1. Channel 15 is Biotel's MED-2. Channel 16 is the Dallas Street Emergencies frequency. The unit can scan or be set to manual, but it cannot lock out frequencies. It can also be set to monitor one frequency as priority. As far as we have been able to tell, most Dallas police car radios are identical in set up to this one. (My only question is, how do they monitor the Intercity frequencies?)

Scanner 8 is a Radio Shack PRO-2027 that monitors the Dallas Police, the Dallas Fire Department, Care Flight, all area EMS, all 10 Biotel MED

channels, the Dallas County Sheriff's Office, the Texas Department of Public Safety, and all other state law enforcement frequencies--like the Texas Alcoholic Beverage Commission. It also monitors all the local media's frequencies (our competition) as well as the FBI, DEA, Customs, FEMA, EPA, ATF, Secret Service, and IRS Criminal Investigations Division.

Scanner 9 is a Radio Shack PRO-2036 that we use to monitor every trunked 800 MHz public safety frequency in the the Metroplex. This provides redundancy to Scanners 1 through 6 to make sure we don't miss anything.

Scanner 10 is leased to us from the City of Plano's Police Department. It is a Plano police officer's handheld unit. It too is capable of transmitting, but we restrain ourselves. (Although there was that one incident where I accidentally pressed the little orange "officer in distress" panic button. The results weren't pretty.) The frequencies in it are trunked talk groups. By using an actual police radio, again, we don't have to worry about not being able to follow trunked communications.

Scanner 11 is a Radio Shack PRO-36. This one is kept on manual all the time and is set to the Dallas Fire Department's Engine Response Frequency. By never scanning, we can be sure never to miss a fire call in Dallas. The Engine Response frequency gives us everything we need to get a crew to a fire scene--location, address, units responding, time out, equiptment taken, the number of alarms, and all the times and numbers.

Scanner 12 is a Radio Shack PRO-2036. This one is filled with every police, fire and EMS frequency in the Metroplex that is NOT a trunked frequency.

Scanner 13 is also a Radio Shack PRO-2036. It is the "Aviation" scanner. This one monitors the frequencies of every airport in the Dallas area.

Scanner 14 is a Radio Shack PRO-2036 too. It is the "Transportation" scanner. It monitors the Dallas Area Rapid Transit system, Greyhound, the taxi companies, and all the Railroads that run through Dallas.

Scanner 15 is a Radio Shack PRO-2006. It is set up to monitor Dallas area frequencies only, emphasing police, fire, and EMS. It sits in the News Manager's Office.

In addition to the above, each photographer has a scanner in his or her car.

And yes, I actually monitor all those scanners at the same time. After 11 years in the business, I've gotten the hang of sorting out useful data from 14 voices going at once. Beleive it or not, it's not that hard. You just have to learn to listen for code words.

For example, I know that a "Signal 27" is a dead body somewhere. If it was called in by the Dallas Fire Department it is most likely a natural death. If CAPERS (Crimes Against Persons) or Homicide is called on a "27" call, it is very definitely a murder or suicide. If Gangbusters (the Gang investigation unit), PES (Physical Evidence), or YFS (Youth and Family) gets called, I know that whatever the crime is, it's a big deal and that I'd better stop what I'm doing and start listening.

If Dallas Fire calls for "984" I know that the Fire Investigator is being sent to the scene. I know that Dallas Fire Department engine and truck numbers correspond to the station number they were dispatched from. So when I hear Engine 30 get sent to a fire, I can go to my map and look and see where station 30 is located. In other words, Engine 30 comes from Fire Station Number 30. So does Truck 30. I also know to look on the map for the nearest fire station to number 30, because that is where assist calls will be coming from. Knowing that ambulances are always numbered "7" something, I know that if I hear engine 30 responding to a fire, I know to listen for "730" to be called out, because it will most likely mean that someone's hurt at the fire that engine 30 is working. I also know from looking at the map that Stations 45 and 18 are closest to Station 30, and that therefore other ambulance calls might be "745" and/or "718". Lastly, I know from looking at the map that the fire is taking place in the Dallas Police's Northeast Patrol Division, which is Channel 2, and to therefore listen for units number "2" something, because any police help sent would be numbered this way.

I know that a police car numbered "422" is on Channel 4, the Southwest Patrol Division, because the unit number begins with 4. I know that unit "520" is a supervisor (sergeant rank or higher) in the Northwest Patrol Division, which is Channel 5. I know this because the unit's number begins with a 5 and ends with a 0.

I know if I listen to the Biotel MED frequencies, that I will hear paramedics giving patient condition reports to hospitals. I know most of the terminology. I know that "an IV of Ringer's" is an IV of Ringer's lactate plasma, which is always used for liquid replenishment and for treatment of shock. I know that "TKO" means the IV is "totally kept open" and that therefore liquid replenishment is very important--in other words, the patient is in shock. I know that "Albuturall" is a medication commonly used for various types of respiratory distress. I know that if a patient's eyes are "normal and reactive" that that's a good sign, and that "pinpoint pupils" or "fixed and dilated" means either a severe drug reaction or the guy's a goner. I know that a "blown pupil" is very bad because it means there is probably bleeding inside the skull. This is potentially fatal. I know that "clear bilateral" means there doesn't appear to be anything in the patient's lungs. I know that a "3 lead" is a transmission to the hospital of an EKG or heart status. A "12 lead" is the same thing only much better detailed. Only Dallas hospitals use 12 leads. The surrounding cities only use 3 leads.

I know that Priority and Code are indications of the seriousness of a situation.

Priority 1 = life is in danger.
Priority 2 = serious, non-life threatening.
Priority 3 = not serious, non-life threatening.

Code 1 = routine, at your leisure,
Code 2 = handle with lights, no siren.
Code 3 = handle with lights and sirens.

Therefore, a patient being transported "priority 1, code 3" is in bad shape.

Lastly, I know that when the Care Flight helicopters make a run, I need to listen for the way the offload is being made. A "hot offload" means that the transport of the patient is so critical that they don't even have time to wait for the blades to wind down on the helicopter. They need that guy off that chopper, now! A "cold offload" means that the transport is still very very important, but at least they can let the blades wind down.

To help you out, you can monitor us on 450.5125 MHz. We are identified as KPE-517. We have repeaters (as well as microwave relay stations for our live trucks) on top of the Nations Bank Building in downtown Dallas (the big green building), and at Continental Plaza in Fort Worth. There is also a two-way repeater and a microwave receiver at our main transmitter site in Cedar Hill.

Dallas Base (aka Dallas News) is my desk. Fort Worth Base (aka Fort Worth News)is the Assignment Editor in Fort Worth. T.O.C. is the Technical Operations Center--the control room for in Fort Worth. This is the "brain" of every newscast and if you hear them call a truck there is a big problem with the signal. Units 10-18 are photographers working on the Fort worth side of the Metroplex. Units 20-27 are Dallas-side photographers. Unit 10 is the Chief Photographer and Unit 20 is the Assistant Chief Photographer. Unit 30 is me or sometimes a freelancer borrowing my equiptent. "SKY EYE" is our chopper. We also call it "Chopper 11" or more commonly we call for "Chopper Julie" our pilot.

ENG stands for "electronic news-gathering." The ENG trucks are the live trucks--the vans with the collapsable telescoping antennas. ENG-1 and ENG-3 are based in Dallas and ENG-2 and ENG-4 are based in Fort Worth. Sometimes you may hear a truck on the wrong "side." This is because logistical concerns deemed it necessary for them to go to the other side. Wherever an ENG truck goes there will be a live shot so pay attention to these calls. The ENG trucks use a 7 GHz line-of-sight microwave shot to get signals out. It is not uncommon for these trucks to experience trouble establishing a signal link to the studio.

SNG stands for "satellite news-gathering." These are the humongous trucks with the satellite dishes on top. They are used only for very long distance shots that require us to bounce a signal off a satellite instead of using a line-of-sight microwave shot. Or sometimes, we need to cover a major event for the network (like a presidential visit) and do a live uplink.

> > (Considering the ones that are listed, I can't think of anthing
> > particularly sensitive that might have been left out)

If what I've been told is correct, the unassigned numbers are being held open for future expansion of the Signal Code system.

> > Also, out of curiosity, why do different departments use such
> > different signals? (I'm used to a small town that used the
> > extended 10-codes)

This reflects the standards of the city in question and probably has to do with the nature of the crimes most commonly committed there. Dallas has

far more shootings, stabbings, rapes and murders than Richardson or Garland for example. And the Signal Codes reflect that. Garland, however, has more burglary, tresspassing, criminal mischeif and traffic-related stuff. Their codes reflect that.

> > --
> > Joe Bramblett
> > bofh@joeb.psyberlink.net

Hope this information is useful to you! Enjoy your monitoring!

If there is any frequency you need that you think I might have, give me a call, but only before 7 AM or between 10 AM and Noon. Other times are extremely busy.

>is a reliable source to) they will only use such info against us.

Heck no! IMO, MORE is better.... More as in More Methods which
can be used to receive Cellular Calls... Like:

Go down to your local thrift shop and look through their
used television selection. Find one with separate, rotary
UHF and VHF tuners. Look at the UHF tuner to see if it goes
up to channel 83. If the UHF tuner uses detent stops between
channels, investigate the fine tuning control. If the fine
tuning control covers a broad range, or if there is not detent
stops between UHF channels, this set should work fine for receiving
cellular calls.

FOR THE MORE TECHIE READERS: If you can obtain a schematic for
the set, you might try tightening up some of the bandwidth
parameters within the set.

MORE TECHIE: A secondary tuner, working at the IF frequency of
the TV set, will allow you finer control and rejection of various
signals within the passband of the TV set.

EVEN MORE TECHIE: With a few additional parts, connected to the
IF circuit, you can change the picture tube into a poor man's
spectrum monitor and be able to visually spot spikes within
the currently tuned bandwidth and steer the demodulator section
towards those spikes, which will inevitably be cellular calls.

Congress operates by creating a problem that needs to be solved.
Reps then fan the media into a frenzy and lobby their colleagues to
help them pass a law to "send a message."
Then the campaign contributions roll in for another week's good work done.

And it begins again. Another crisis, another law, another deposit into
the re-election warchest.

I picture sort of a big Spirgraph turning and turning. With every turn
it draws in a tighter and tighter boundary to our freedoms.

These anti-scanner laws *should* be fought.

I doubt that it'll be a winning battle. Look at how the NRA and
pro-choice-on-firearms do with Congress. And in that case, there is
a very specific amendment to the Constitution to prohibit Congress
from doing the very things they continue to do.

"When freedom is outlawed, only outlaws will exercise freedom."

They wanted an easily modifiable scanner so they could modify it in
front of the TV cameras. If they would have gotten a newer model, it
wouldn't have made the impact they wanted.

When recording to your soundcard you must use you Microphone input jack on your sound card, NOT the line input jack. The mic jack is high impeadence like the output of your scanner. For those of you with Soundblaster 16 cards open your creative mixer panel and go to your recording settings. Set the Automatic Gain Conttrols to on. There is a Shareware program called ReCall available for download at http://www.sagebrush.com/~sells/
This is a voice activated recorder that will record transmissions to a wave file. The sample rate can be set so you can record an hour of conversation taking up only 2 megs of your hard drive. Far better than using Sound recorder or Wave Studio. They use 2 megs for 5 minutes.

: for my department.

The thing I've always found ridiculous about this topic, is that some people must have no life whatsoever, to want to monitor phone conversations in the first place. I mean, these are probably people they don't even know, so who cares? The topic often comes up that hams' conversations on the air are so dull; I'm sure that the average person's telephone conversations are equally as dull, if not more so. "When are you coming home? Pick up a loaf of bread and a gallon of milk on the way."

And this idea of tougher legislation is so ridiculous. How the hell can this be enforced, even more so than the current regulations? All we need is one more unenforceable law.

Do you know what you are talking about? The BC9000XLT with or without the CTCSS board for well under $500 you can't beat that. A friend of mine has the 9000XLT and it is a damn good scanner for any money. I have the BC350A, PRO-26, and the now discontinued PRO-2035 and I am not complaining at all. With all the junk that is in the airwaves now it is near impossilbe not to have problems with junk images etc. Here in Washington there is so much junk in the airwaves with all the cellular, paging, and numerous government agencies all relying on radio communication. I scan each and every day and have no problems what so ever to speak of with my scanners, which certainly are not the best there is on the market. Pager junk, I don't know what freqs your scanning but they have set freqs and sure there are images etc but stay away from those freqs, or try a CTCSS board in your scanner. What freqs are you scanning? What other scanners are better in your mind? Icom AOR? What is your idea of the "ideal scanner" with no junk etc? I'd really like to know.

782. Toshiba 900 Mhz phone (FTH955)

Newsgroup: rec.radio.scanner
Date: 1997-02-07 00:00:00 UTC
From: 204-0841@mcimail.com.abc
Message-ID: <32FB8127.110F@mcimail.com.abc>
Source record: 208485

I've recently scanned usenet looking for info on 900 Mhz cordless phones. It seems that most of the posts go here and comp.dcom.telecom.tech with the latest stuff here so I'm posting here. I've found a lot of useful info in usenet so I thought I'd share my opinions and experiences as well. I'm sorry for the lengthy post but I tend to ramble on a bit :)

I recently bought a Toshiba FTH955 900 Mhz digital speakerphone. Info on Toshiba's cordless phones can be found on the web at:
http://www.toshiba.com/tacp/products/index.htm
This phone replaced a year old GE 49 Mhz cordless which performed well except for the occassional interference. As others have stated, the Toshiba phones do look very much like some VTEC models and I'd agree that they are in fact the same. Overall, I've been satisfied with the Toshiba. Sound quality is good on both ends. Being digital, there is never any static in the signal. I haven't noticed any echoing that others have mentioned. Surprisingly, the old GE's voice quality was a little bit better (when there was no interference). I also like the extra features like speakerphone and intercom. I am somewhat disappointed by the range. All I've ever heard about 900 Mhz phones is how great their range is. I've seen claims from 2X to 9X the range of 49 Mhz phones. Well, I live in a house on a normal smaller town city block with no big buildings anywhere in sight. In this environment the Toshiba's range is about the same as the old GE 49 Mhz. As I walk down my street, the Toshiba begins to experience 'digital dropout' at around 150-200 ft. You can continue out to 400 ft or so but the dropouts become rather severe limiting your ability to carry on a conversation. I was so surprised by the limited range that I thought the phone might be defective so I called Toshiba tech support a few times. To summarize, they said that while the range did seem a little short, I should be satisfied with 200-300 ft of range in my enviroment and that Toshiba phones should perform similar to other phones on the market. They did say that it was a possiblity that my particular phone could be a little 'out of tune' (whatever than means). I've got a few days left on my 30 day return period and at one point was considering getting a new one but from what I've read on usenet it seems that many non-spread spectrum phones have similar ranges. Comments? Am I expected too much?

Since everyone on usenet raves about the spread spectrum phones, I went out and bought an Escort 9100 from Sam's Club (they didn't stock the 9600 as others have mentioned). This phone has voice quality similar to the Toshiba. Neither really stands out in a side by side test although my wife claims that she can hear her voice echo on the Escort. I haven't really noticed. Is this what everyone refers to as 'sidetone'? I don't like the flush keypad of the Escort or its lack of other features like a

speakerphone or intercom. The Escort also has a louder backgound hiss than the Toshiba. Its still quiet enough but its not as quiet as the Toshiba. The Escort does stand out in range. In my tests, the Escort can go about twice as far as the Toshiba even inside my car. Being inside the car really decreases the range of the Toshiba for some reason. When the Escort goes too far you begin to experience this sort of crackling effect which is different than digital dropout. The effect is difficult to describe in words.

I've sort of convinced myself that I like the features of the Toshiba and can live with the limited range (plenty good enough for around the house, in the yard, etc) so I'll probably keep it and return the Escort. If I knew of another direct sequence spread spectrum phone with speakerphone, intercom and volume control, I'd probably consider it. From what I've read about Escort phones on their web page, there isn't an Escort model with a speakerphone.

I'm wondering if my experience is typical? Any comments are very much welcome. I've seen a few posts with requests for info on Toshiba 900 Mhz phones so I hope they find this info useful.

783. Congressional cellphone hearings could end the hobby

Newsgroup: rec.radio.scanner
Date: 1997-02-07 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <E58y3I.B2s@ennews.eas.asu.edu>
Source record: 208486
Cross-posted to: rec.radio.scanner,alt.radio.scanner

While the congressional hearings on cellphone monitoring are disturbing to many members of the hobby, there is more at stake here than just the ability to listen to cellphone calls. While it may be true that cellphone monitoring is the only issue on the table now, the increasing anti-scanner sentiment represents a disturbing trend. I personally have no interest in cellphone monitoring, and I would love to see images "outlawed" because they are a source of unwanted interference. But, I realized today that even people who are not at all interested in cellphone monitoring should be concerned about the issues being discussed in Congress.

Why does it matter, you ask? Well, through much research and creative engineering, I have managed to obtain a copy of the following newspaper article from March 17, 2004. Yes, it's more than seven years in the future, but it's something we need to begin thinking about now...

*****

MARCH 17, 2004 - CONGRESS VOTES TO PROTECT PUBLIC SAFETY
Criminals No Longer Able to Eavesdrop on Police

In a rare unanimous vote, both houses of Congress have approved the Public Safety Communications Privacy Act. The act, which makes it a federal crime to monitor any police, fire, medical, or ambulance radio transmission, is expected to be signed into law by the President before the end of the week. In addition to the prohibition on monitoring, the act also makes it a crime to use, posess, or sell any radio receiver which is capable of directly or indirectly monitoring any public safety radio communication. Employees of public safety organizations and members of the news media are exempt from the provisions of the act.

Support for the act was tremendous. Average citizens, concerned for their safety, can rest assured that criminals will not be able to monitor police communications. Public safety workers, long concerned about the use of "police scanners", will no longer have to worry about eavesdroppers showing up at the scene of incidents. When told about the passage of the act, Mildred Jones of Dover, MD said, "I'm so glad those electronic stalkers and technocreeps won't know when I call the ambulance!"

During the weeks prior to the passage of the PSCPA, a few lobbyists and citizens attempted to claim that the airwaves are public property and should not be subject to such privacy regulations. They argued that there is no reasonable expectation of privacy when a signal is transmitted using an unscrambled radio system and that citizens have a right to monitor the activities of public safety departments.

Based on the precedents set by the Electronic Communications Privacy Act of 1986 (which made it a crime to monitor cellular phone calls, live remote broadcast link-ups, scrambled communiations, and certain other private radio communications), the Telephone Dispute and Disclosure Resolution Act of 1994 (which made it illegal to monitor cordless phone calls and also prohibited the manufacture or sale of radio scanners which could be easily modified to receive cellular phone frequencies), the Cellular Scanner Prohibition Act of 1999 (which made it a federal crime to use, sell, or posess any radio device capable of directly or indirectly monitoring cellular phone conversations), and the Unauthorized Receiver Confiscation Act of 2001 (which allowed authorities to execute random searches on the homes and vehicles of persons suspected of posessing an illegal radio receiver), the arguments against the passage of the act were found to carry no weight.

Owners of radio receivers which violate the PSCPA will have until April 5, 2004 to turn their scanners over to local authorities for destruction. After the grace period, local and federal authorities, in accord with the Unauthorized Reciever Confiscation Act of 2001, will begin searching homes of known scanner owners for illegal radio receivers. Persons found to be in posession of radio devices which violate the PSCPA will be subject to a fine of up to $500,000 and up to 10 years in prison for each unauthorized reciever.

*****

If it sounds implausible, think again. I'm normally not one to be "paranoid", but I have seen the tremendous increase in anti-scanner sentiment, and I know that a "minority" hobby such as scanning is an easy target for legislation such as this.

An almost funny story. When picking up a friend at McCarran in Las Vegas,
I dropped my Icom 2SRA on the X-Ray conveiror belt. It got caught between
belts after leaving the machine and tumbled a little before I fished it
out. The only comment security gave me was "two antennas". I guess after
the "shake test" no one expected my radio to blow up. BTW, of all the
times the receive antenna has fallen out this wasn't one of them. Go
figure.

Good thing I put my change in the little basket. ;-)

This is an older scanning communications receiver (around '83 I think), which was designed to support RS232 option (which was never made as I understand from the manufacturer. Color LCD display, 25-999MHz, triple conversion mobile unit. Very nice.

I am interested in hearing from anyone out there who had or has or knows about this receiver. I would like to piece information on this to see if I can put together an RS232 interface for it.

I have a manual but am particularly interested in a technical manual which is out of print.

Any leads?

Thanks

From what I've seen, all the dual-band rigs that are capable of VxV and UxU, as well as VxU will be capable of doing what you're talking about. I use an Icom Z1A, but the Yaesu FT-530, Kenwood TH-79A, Icom W31 & W32, etc will all do that.

I have the following forsale:

IC 2GXAT - HP
7 watt out
2m / with extended rx
like new, with leather case.
$180 shipped.

IC Z1A Dual Band (2m/440)
5w
detachable remote speaker mic
extend rx and tx
(Have parts for cell mod, but have not done it)
$260 shipped.

Both radios come in original boxes w/ antenna, bat, charger, manual
Both radios are in "new" cosmetic/electronic condition.
I prefer money orders.

I will be away from my mail for the weekend, but the first
person who says "I'll take the ___" , gets it. E-mail time stamp.

I'll write back on monday,
If you want it really bad, call me at home,
Richard Reider 301-490-5539.

(WILL TRADE BOTH RADIOS FOR A PRO2006,AOR8k,FT50R w/cell,Scout, or R7000)

Well Jim, you have to figure it's probably the same group or type who
monitors those "nasty" 20m and 80m frequencies then reports on them. As
if anyone with a radio couldn't do it themselves or better still it's as
if anyone with a radio really gives 2 poops about it in the 1st place.

Just a musing, that's all

Even a year and a half ago your policeman friend was wrong.

It has been against the law to monitor ANY mobile/airborne telephone
conversation in the USA since 1986. Cordless phones were added to the
list in 1992. In the meantime, your cop friend evidently has no clue
about proper search and seizure. Send him back to the academy.

Good point on Search and Rescue. SAR budgets are already tight.
New laws will either cripple radios and/or make them more expensive.

writing
>to my congressman is going to do squat.

Creative counter arguments are needed. One that I've come up with is the
detrimental effect crippled radios will have on Search and Rescue.

As more and more people use cell phones, including those who take them on
hikes in the mountains (as is the case in WA state), the ability to do
direction finding on persons in need will go down. Direction finding
equipment requires a radio that can receive.

Any more ideas? Then, put these into a letter to your reps.

> >
> > >
> > > DaveOne good reason to keep the channels open to the general scanning public,
is to assist law abiding citizens in notifying agencies regarding such
activities that the "Monitor" considers to be Seriously illegal. That
means, if a call comes down about kids smoking pot, and you're in the
neighborhood, you WOULD NOT Get on your Cellular to tell the Agency that

the kids are still in the reported area. (IMHO, kids will be kids, I was one once.)
It WOULD BE BENEFICIAL, if they BROADCAST a STOLEN CAR or some-thing worse. IF YOU SEE the Vehicle they describe, (thanks to your scanner) then you should help them, by reporting the spotting of the vehicle in question. I'm sure the owner of the car appreciates the help.
IT SEEMS THAT THE AGENCY should keep channels open for this purpose. If they take this away from us, then society is truly lost.

What is the model number?

BTW, I've done some additional testing a need to update the info in this prior post. It turns out that my Toshiba FTH955
and Escort 9100 actually have similar ranges. When testing range until the handset can not longer communicate with the
base unit, the Toshiba can go 600-650 ft and the Escort just a little bit farther, maybe 650-700 ft. This gives these 900
Mhz digital phones about 1.5-2x the range of my old GE 49 Mhz 10 channel phone. Its interesting that the Escort box
proudly proclaims '8 times the range conventional phones' (not an exact quote). One difference between my 900 Mhz phones
is that the Toshiba starts to experience dropout sooner and the sections of the message which are lost during the dropout
are slightly larger than those of the Escort. I'm intentionally trying to closely scrutinize the differences. In actual
use, the differences appear less pronounced. I was also wrong about the Escort 'echo'. It does indeed echo your voice
quite a bit. The Toshiba doesn't seem to echo at all. So, at least in my situation, I'm not seeing a tremendous advantage
of spread spectrum digital over regular digital (10 channel autoscan).
I think I'll stick with the Toshiba for now.

Has anyone tried the Escort 9701 yet?
According to their web page, it supposedly has up to twice the range of the 9600.

MATT,

I don't think you have your facts straight here. The they use
radio waves. you can't pick them up on a scanner and decode them. Nor
can you access them from computer unless you can call into the main
frame and access it. IF in fact you can do this. I would suggest that
you go immediatly to the patent office and patent the way you do it.
Then Go make a million dollars showing local police how to secure the
system. If you don't want to please tell me I'll do it and give you
10 percent :). I will check for sure on what you say as I know one
of the people who developed this and works for Motorola in the area I
live.

Dave,

You are correct I do not post my real e-mail as I do not wish to
recieve all sorts of crap. I was however niave enough to think ME@ME
was somewhat original. I guess it was'nt (sex.incest.com?) Yow I'm
changing my name.. I am at times argumentative and sometimes
antagonistic. I am antagonistic in some post's to see wether I will
get a stupid response from someone who can't cut thru the crap, or an
intelligent post, like the one I recieved from you.

The first time I saw a post on this subject I thought I read the word
"RIGHT" somewhere. I could be wrong. I still think that there needs to
be a section on broadcasting that police officers can use that only
they can moniter. That should quell the Officer safety issue. That
channel though should be taped as to allow retrival. I guess because I
am a Deputy Sheriff I don't see why people would want to sit and
listen to a scanner. I am sure there are things I think are
interesting that other people do all day and find not so interesting.

Well I see we are on the same general track. Sorry about the abusive
statement in the last post. REALLY sex.incest.com??????? I am on a
list now are'nt I!!!! I HATE THAT! :)

Good Luck in your endeavor.

Hello All,

I'm looking for a HAM radio VHF/UHF transceiver also capable of
scanning and receiving TWO frequencies AT THE SAME TIME. I would like
to use this feature to monitor both the repeater input AND output
frequency AT THE SAME TIME.
Also, is it possible to pre-program the 1st receiver to search and the
2nd one to track it at a fixed frequency spacing (such as 600KHz)?
This is useful to find HAM repeater frequencies.
I've heard about the Kenwood TH-79A, but I'm not sure it can do what I
need. Any pointers would be really appreceated.
Thank's!

When responding, please email directly in addition to posting
here, since our news server isn't very up to date. Please note
that you must edit the reply email address (remove the .NOSPAM
postfix). This has been done in an attempt to reduce the amount
of junk mail received here from automatic mailers. Thank you.

regards,
techno

You are probably using a patch cord that has too much attenuation.
You can make your own patch cord by placing a 100 ohm resistor across
the audio output plug from your scanner and around 1kohm resistor
across the sound card side. Connect both ground ends together, and
connect a resistor of around 10k (try various values in this range)
between the two tips. I use this to record directly from my scanner,
and it works great. I do, however, have an old mono soundcard. For a
stereo one, I would think using two separate 10K resistors from the
tip of the scanner audio output plug to each tip of the stereo input
plug on the sound card would work (or just use one and you will record
just one stereo channel).

Here in San Diego that has never been a problem (a multi-site system),
using a NAF 5000 whip on a STX (w/o auto-affiliate) the problem is
what angle to set the radio to minimize the phasing from the different
sites.

I am sick of watching our so called government protect us to death. One after another laws are passed from stupid seat belt ordinances to scanners are more deadly than hand guns. I am traditionally a left winger polictically. I have owned 4 different scanners in the last decade. I listen primarily because I am a journalist and have a deep deep distrust of law enforcement. It is neccessary to question the official word for more often these days its a lie. I used to feel my freinds on the right wing were not playing with a full deck when talking of government policy. Not any more, while I still differ in veiws I welcome the conservatives as protectors of some of the same things I feel strongly about, (CIVIL LIBERTY). Seat belt laws were not to protect us they were to save insurance costs and give the local PIGS another reason to stop you if they otherwise did'nt have probable cause. Now our state will seize your vehicle if your license is revoked. Their using the money to build another damned health club for the "PUBIC" servants. We cannot even get a decent assualt weapons bill but radios are super dangerous to society. This is a bunch of crap. Remember radio free europe. Whats next preventative detention (Nazi Germany invented that). It says a lamer pig can incarcerate you for what you MIGHT do. I am sick of all this. SHIT ON THE DAMN GOVERNMENT!!!

subs@ro.com (Casey) wrote:
>Intermod, pager junk, and other garbage on Uniden/Radio Shack scanners
>suck really bad. We need to write Uniden and tell them to get shit
>together. Any comments?

You get what you pay for. Uniden and everyone else making scanners
put in as many components to reduce intermod and images as the market
price will bear.

I have several Radio Shack scanners and a Uniden/Bearcat 9000. My Pro-2004
(made by GRE, not Uniden) is the next best thing to a $2,000 Icom I've
ever used, it hears no intermod, images or anything else it's not supposed
to hear, and I live in an area saturated with garbage.

Another problem that isn't the scanner's fault is the quality of signals
eminating from the myriad of transmitters. Since the FCC quit giving a
shit about anything but Pirates and Broadcast stations, more and more
paging and 2-way radio companies, etc. quit trying to keep their signals
as clean as possible.

I know one clown who owns mountaintop real estate and operates a Land
Mobile and Paging company, ORDERED his Senior Tech to detune the
transmitters on the mountain to spew RF garbage to piss off his
competitors. I rode the helicopter with him, I saw it first hand.

So, don't be so quick to blame the scanner companies. You might consider
getting a scanner with CTCSS (PL) tones which effectively eliminates the
problems of intermod and images in scanners. Uniden makes several models
with this option. Radio Shack has one also that I'm aware of. Relm does
too.

Happy scanning,

I have never heard the term "RP" on NYPD radio. Perhaps you mean "RMP"
which stands for radio motor patrol. Keep in mind You're listening to New
Yawkers on the radio, so saying RMP fast may sound like RP.

Listen to the past
Cell laws enacted for a few
so they could make piles of green
I am afghast

Listen to the past
For why the law got through
Money - money - money
Made by them, not you.

People .... who do you think contributes to the campaigns of
these senators and others in the US House of MONEY? The cell
companies must pay sizable sums to get the service of the
elected officials to do their bidding as they dictate.

People...the cell companies are complaining to the people who
they thought were "theirs" and now the people who are "theirs"
have to go out and earn their bucks...or the Cell companies will
find others who will be more than glad to sell out to MONEY>

Think. Why was the Law passed in the first place? What lies
were invoked by the lobbies to persuade the elected officials
to enact a law against listening.

Think....why is Congress considering laws against the Internet
and what can be written about....? On the net. There is a fool
called Feinstein who is all for reguating the net because she don't
want children to read those bad words she is so full of.

Plus more like her. The net is too free. That is their premise.
There is too much freedom on the Internet and Feinsteinis afraid
that people can transmit how to make the atomic bomb over the net

and blow up her office. this is the mind-set we elected to the Senate and congress.

It's the same with Cell Laws / Scanner Laws.

The people who are elected have their own agenda. to protect their own. To protect their turf. Plenty of laws to enact so they will be able to put in jail anyone who "knows that they are planning to...".....

Get this: a woman is being arrested for putting coins in parking meters as she walks down the street in a city near you. The cop told her that if she puts a coin in a meter that don't belong to her car he will arrest her. He arrested her and now she is before a judge.

she put coins in what is there to put coins into. But the govt. mandated that because she was not the user of said spot, she was violating some law by putting in her coin to keep the meter ticking...which is now against the law to do in that city.

Think of the Scanner Laws to be as a meter...It's there. Voices are heard and now someone is saying that because we determine that your hearing is wrong you will be jailed for listeningto what we do not want you to listen to.

It used to be "saying fuck and shit and cunt and cock" that was jailable. Then people grew up and realized that words having to do with this venue refer to the body. Now we are graduating from saying "bad" to "hearing bad".... we are criminals for being able to listen.

Notice how we are creating the same conditions via our elected officials that China is doing right now...no dissent allowed.

A scanner is a form of dissent if you look at it correctly. A parking meter is like China's Tiannamen Square...it's there and no one is allowed to feed it unless the Tank is yours.

Remember: the fault lies with us. we allowed these little Hitlers ascension to the thrones they know say are theirs. We are witnessing the beginning of a society where the fools we elect can enact laws which will keep them in power because that is their agenda.

It's issues like this which never are corrected by the people. The leaders convince them that to correct it is to destroy it. To destroy their power base is then the crime.

That is when the system will be desroyed. When we cannot change what they started: to fool all the people all the time.

bill conduit
we are not free...just absent.

> digital route on cellular phones, "hardening" the insides of a scanners
> to prevent tampering, and, of course, changing the penalties for
> listening in.
> {SNIP}
>
My simple thought is PROVE I LISTENED I wouldn't be stupid enough to record

or say what I heard via an Intercepted Cell Call. I haven't even listened
to the cell
freqs since 1991 or 1992. The only reason I want them is to hear some Cops
who
have Cell Phones as well as Trunked systems down here in Florida. (Nice to
know
what the cops are doing..) Generally I don't trust anyone (My Cordless is
Digital as is my Cell Phone). But no matter what the Feds say remember They
can't enforce these rules unless a Fed is in every house or there is
someone like the Florida
couple stupid enough to record and send to a Congressmen (who is also an
idiot) a taping of an Illegally wiretapped call. NOTE: Congressman is
idiot for accepting the tape Not for being in congress though this can be
debated..

I would say digital is the best bet at least until some company figures out
how to receive and decode the sigs on a scanner. The reason I say this is
that there are
probably 10's to 100's of thousands of "Cell Capable" or "Cell Enabled"
scanners
already in use. So what are the Fed's gonna do try to confiscate them
(yeah right).
The Feds can't even balance a checkbook how can they enforce any "law" that

nobody knows you violated unless you let them.

As you can Tell I am definitely not a Demagod sorry Democrat or an
Retentive Anal sorry Republican... I am Libertarian (sp). So my opinion is
- If it doesn't hurt someone in a material sense its ok.

I missed his remarks to the committee, But I did catch the afternoon portion of that hearing. And scanner buffs . . . . . .

WE FACE A BIG CHALLENGE TO OUR HOBBY!
Hey Cell phone people, We could monitor the 800mhz band just fine before you came along and bought the public airwaves, Then put UNSCRAMBLED analog signals on them. COME ON!!!! GET REAL!

The only answer is to talk to your Congress person and get the cellular industry to Encrypt their signal. That is the only thing that will keep the feds from raiding homes to confiscate Scanners(unlikly I know).
I for one don't listen to cell phones, Its the issue of blocking coverage that bothers me.
I may be wrong, But that is my 2 cents worth.

The police could take some limited action on it, but not too much.
Anonymous tips are usually more usefull at pointing the police in the
right direction to gather more information on their own than anything
else.

Anonymous tips usually result in the police knocking on a door and
asking to see what's going on. Not much more without more
specific/reliable information.

Bob did not say restrictions on scanners, he said "listening".
You might want to read the Radio Act and the Radio Regulations.
I admit it was some time ago, but I do remember reading reports in the Ottawa papers of a case involving "illegal operation of a scanner" - must have been breaking a law to be illegal.
There are very definite restrictions on disclosing what you hear. It is, for example, illegal to tell anyone what you heard on CB, unless you were a participant in the conversation in which event you might make a case in your defence.
Some of the Canadian restrictions on listening have even found their way into the criminal code. It is just that we generally don't get as excited as our neighbours over these things, and there are very few prosecutions.

Tino,
I suggest you to wait for a little while. ICOM has just put on the market
a new handheld scanner covering 500KHz-1300MHz named IC-R10.
It is an all mode scanner (including SSB), it has 1000 memories with
alphanumerical 8 char. identifier, a kind of graphic spectrum analyzer,
and many other features. Finally, it works with 4AA cells (alkaline or
Ni-Cd). In Italy, where I live, the first units imported are sold out,
and I booked one for me at my city ICOM retailer. I will put an info on
this newsgroup as soon as I will get it to give more technical details
and impressions to all interested guys (and girls).

Ciao, Giovanni.

Thanks to some help from Gary Coffman, I was able to get it up and
running. I had to remove a NO HIMEM line in my boot cfg.
However, I've yet to decode anything legible other than some what
appears to be machine language. I've tried both discriminator and
regular audio as I have taps for both on my scanner.
It's quite possible the local pagers are using some other format
than POCSAG tho...

I think we need a tad more realistic view of getting what you
pay for. What model are you having problems with? Some are designed
better than others. Perhaps you get a "lemon"?
If it bothers you that much(which it appears to), spend about
one or two grand(or more) and pick up an AOR or Icom. Granted,
receiver design has flattened out some lately with manufacturers
concentrating on adding features, but today's crop of receivers
are still wonders, IMHO, for the price you pay.
Don't get all bent out of shape if your $20K family car doesn't
perform like a $100K Ferrari. You want the best, fork up the money.
Until then, cast your vote by not buying Uniden products and
writing them a letter detailing your concerns.

>to use this feature to monitor both the repeater input AND output
>frequency AT THE SAME TIME.

Because I'm looking for such a beast myself, I've done a bit of market
research on my own (tried to post here but no-one answered).

Basically the tranceivers that do this are the Kenwood TH-79, the
Icom IC-W32, the Yaesu FT-51R and the Alinco DJ-G5.

The Yaesu FT-50R has some limited such capability in (I think) being able
to have a primary and secondary frequency and to switch to the secondary
if there's any activity.

The TH-79 and IC-W32 have independent volume and tuning dials for the
two bands. The others only have one dial.

Over in the UK, the FT-51R is the most expensive of the lot, followed
by the TH-79. The IC-W32 is not much cheaper either. The DJ-G5 is a star,
because it's packed with features and is the cheapest of the lot.

>Also, is it possible to pre-program the 1st receiver to search and the
>2nd one to track it at a fixed frequency spacing (such as 600KHz)?

I don't think this is possible in any of the above.

I have been hearing alot of talk lately about it being illegal to listen to any type of phone conversations on a scanner. Can some one tell me what the law actually restricts. I had a conversation with a policeman friend of mine about a year and a half ago, and he told me that listening to cell calls were illegal but cordless was not and that the police could use cordless interceptions to get seach warrants for drug traffic. Has this law changed?

Thanks
Chris

Cordless & cell phone listening are illegal. Cordless phones were added
to the Privacy Act back in the end of 1994. There are many who still
aren't aware of the fact that you cannot listen to cell phones. Of course
there may be local laws that over ride such federal laws.
Ryan

> (Nazi Germany invented that). It says a lamer pig can incarcerate you
> for what you MIGHT do. I am sick of all this. SHIT ON THE DAMN
> GOVERNMENT!!!
You're talking out of both sides of your mouth ASSMUNCH! On the one hand
you're crying for the government to stop trying to protect you from
everything. On the other hand, you want them to ban handguns and
SO-CALLED assault weapons. You lit the candle and you're just beginning
to get the picture. You might want to consider pulling your head out of
your ass now so that you can see the light of day! They are trying to
usurp our freedoms through carefully coreographed campaigns. e.g.
disarming our society by attaching scary names to guns, manipulating
public opinion, then banning arms in the name of public safety. When was
the last time you saw someone walking down the street with an AR-15?
They say we have to get these guns off our streets, but if you have even
half a brain in your skull, you know they're not on our streets in the
first place! They are, however, the most effective weapons that could be
used to RESIST the government (get the picture?). Now they're trying to
claim the airways, which have always been free and open, in the name of
privacy. At the same time they're passing legislation to make it much
easier to remotely tap your phone, and much more difficult for you to
encrypt your communication (so much for their privacy concerns). This
society had better WAKE UP! I've owned these guns for years. I use them
for sport and defense. I've never even considered committing a criminal
act. If you think taking them away from me makes you any more safe then

you're playing right into their hands and you're nothing more than a fool being led off to slaughter. Maybe it will strike home when they call your receiver an ASSAULT SCANNER, and try to paint you as a pervert for evesdropping on other peoples conversations. "We need to get those high-channel-capacity assault-style-scanners with conspicuously-protruding-antennas off our streets! They could compromise the integrity of law-enforcement-communications. Police officers could be killed! The small handful of people that use them for non-criminal purposes just need to get a new hobby." Keeping the airways open, like keeping society armed, is an important check (as in "check and balance"). It is a measure to help make sure that police and government don't operate in secret and have absolute power. OPEN YOUR EYES WIDE NOW!

"This year will go down in history. For the first time, a civilized nation has full gun registration. The streets will be safer, our police more efficient, and the world will follow our lead into the future."
--ADOLPH HITLER, 1936

"This year will go down in history. For the first time, a civilized nation has full SCANNER registration. Communications will be more private, our police more secure, and the world will follow our lead into the future."

Ryan,

They're working on it! If the cellular industry gets its way we won't be able to buy anything more sophisticated than an AM-FM transistor radio.

I have already written a letter to Thomas Wheeler, pres. of the Cellular Telecommunications Industry Association, demanding a written apology for his libel of myself and other legal scanner owners by calling us "electronic stalkers." I have also contacted an attorney about a class action defamation lawsuit should that apology not be forthcoming. Interested in joining in?

John

apparently a unit that is "easily modifiable" that is no longer sold. If these chumps would do a little homework, they might know that you can't purchase scanners that are "easily modifiable" in the US anymore. Just ask the Martins!

PIGS another reason to stop you if they otherwise did'nt have probable cause. Now our state will seize your vehicle if your license is revoked. Their using the money to build another damned health club for the "PUBIC" servants. We cannot even get a decent assualt weapons> bill but radios are super dangerous to society. This is a bunch of
crap. Remember radio free europe. Whats next preventative detention (Nazi Germany invented that). It says a lamer pig can incarcerate you for what you MIGHT do. I am sick of all this. SHIT ON THE DAMN GOVERNMENT!!!

You're talking out of both sides of your mouth ASSMUNCH! On the one hand you're crying for the government to stop trying to protect you from everything. On the other hand, you want them to ban handguns and SO-CALLED assault weapons. You lit the candle and you're just beginning to get the picture. You might want to consider pulling your head out of your ass now so that you can see the light of day! They are trying to usurp our freedoms through carefully coreographed campaigns. e.g. disarming our society by attaching scary names to guns, manipulating public opinion, then banning arms in the name of public safety. When was the last time you saw someone walking down the street with an AR-15? They say we have to get these guns off our streets, but if you have even half a brain in your skull, you know they're not on our streets in the first place! They are, however, the most effective weapons that could be used to RESIST the government (get the picture?). Now they're trying to claim the airways, which have always been free and open, in the name of privacy. At the same time they're passing legislation to make it much easier to remotely tap your phone, and much more difficult for you to encrypt your communication (so much for their privacy concerns). This society had better WAKE UP! I've owned these guns for years. I use them for sport and defense. I've never even considered committing a criminal act. If you think taking them away from me makes you any more safe then you're playing right into their hands and you're nothing more than a fool being led off to slaughter. Maybe it will strike home when they call your receiver an ASSAULT SCANNER, and try to paint you as a pervert for evesdropping on other peoples conversations. "We need to get those high-channel-capacity assault-style-scanners with conspicuously-protruding-antennas off our streets! They could compromise the integrity of law-enforcement-communications. Police officers could be killed! The small handful of people that use them for non-criminal purposes just need to get a new hobby." Keeping the airways open, like keeping society armed, is an important check (as in "check and balance"). It is a measure to help make sure that police and government don't operate in secret and have absolute power. OPEN YOUR EYES WIDE NOW!

Here is what I sent to my representatives in Congress. Don't sit and cuss at the dark. Light a fire! Those of you who posted all those rantings and ravings would be better off telling your Congressional representatives what you think than commiserating with your friends.

"It is time for the electronic stalkers... to stop thumbing their nose at the Congress and trampling on individuals' rights,"

I think from this quote one can infer that Rep. Tauzin thinks there is a problem with electronic evesdropping. I don't. I'm a Maryland resident, and an Electrical Engineering graduate of The Johns Hopkins University.

Rep. Tauzin thinks the Electronic Communications Privacy Act (ECPA) ought to be strengthened. What he doesn't realize is that the law is technically impractical to enforce. It is a bad law and it is based on some faulty assumptions about how the technology works.

The ECPA regulation itself is based on a rediculous notion that the general public shouldn't look inside what can only be described as a house made of glass. Anyone with even the slightest inclination can modify a scanner to receive the cellular telephone band. There are far too many ways to receive the cellular telephone band to bother legislating against, and there is no way one could ever find someone who had defeated any of those measures.

The real problem is that there is no encryption on the cellular calls. This emperor has no clothes on, folks. What happened is that the cellular industry convinced Congress that a rediculous law, the ECPA, was reasonable. No engineer, technician, or hobbyist in their right minds took them seriously when they made this foolish proposal back in 1994. But Congress did.

Ignorance of technology is no excuse for a bad law any more than ignorance of the law is an excuse for breaking it. The laws of physics are not subject to a voice vote. What Rep. Tauzin wants to do is not practical, not enforceable, nor is it good policy. Instead, I call upon you to repeal the Electronics Communications Privacy Act (ECPA). Ask your fellow Congressmen why, with encryption being so cheap, easy, and secure --why are we still telling folks not to look at the naked emperor?

But they don't do their homework, unless it involves campaign
contributions, influence peddling, or power. One of the truly
frightening things is how little most of these jokers know about
anything connected with technology, or many other areas for that
matter.

Creative counter arguments are needed. One that I've come up with is the detrimental effect crippled radios will have on Search and Rescue.

As more and more people use cell phones, including those who take them on hikes in the mountains (as is the case in WA state), the ability to do direction finding on persons in need will go down. Direction finding equipment requires a radio that can receive.

Any more ideas? Then, put these into a letter to your reps.

have successfully taken away our tools to do so? You thought they'd only
go after our freedoms, and leave yours intact? Hahahahahahhhaaaaaa...
Control crime, not guns.

:> We cannot even get a decent assualt
:> weapons bill but radios are super dangerous to society. This is a
:> bunch of
:> crap.

Both are dangerous for the same reason. "Criminals" use a small percent
of them in committing crimes (in fact, they *don't* use assault weapons,
they use handguns!), while the remainder are owned by
law abiding citizens. But hey, don't be a hypocrite! If you trust
government enough to protect us all when only criminals have guns, you
should trust it enough to not worry about what is being said on the radio
waves...

: You're talking out of both sides of your mouth ASSMUNCH! On the one hand
: you're crying for the government to stop trying to protect you from
: everything. On the other hand, you want them to ban handguns and
: SO-CALLED assault weapons. You lit the candle and you're just beginning
: to get the picture.

I don't think he does get the picture. If he did, he'd have done a 180
on the "assault weapons" issue.

: You might want to consider pulling your head out of
: your ass now so that you can see the light of day! They are trying to
: usurp our freedoms through carefully coreographed campaigns. e.g.
: disarming our society by attaching scary names to guns, manipulating

This is why we have lobbiests. Heck, we could assemble a lobby right here on rec.radio.* and hire a pro to educate these guys on radio matters of interest to us (If we could agree on anything :-)

Maybe a govt. supported vacumm tube industry to keep all the old radios going right through the big EMP and Xtal radios in 33% of all cracker jack boxes.

Scanner and SW content: I am looking for an old Geloso receiver and also for any early 'microcomputer free' synthesized receiver.

>I wish he had a clue......

I myself like the TV ads for the home HIV test where you call in to get your results on your CORDLESS PHONE. It's all secret and secure because you use your secret number on the package. Of course there is no one like me listening who knows what frequency your phone uses along with your typical signal strength and the sound of your voice. DUUUUHHHHHHHH (I would never do such a thing because the government says I'm not allowed.) (I don't speed in my car either.)

I don't remember who said it, but: "The navy had a policy during WWII." "If you don't want anybody to hear your transmission, DON'T TRANSMIT!!"
Obviously the ships didn't have phone wires trailing them, but YOU DO. If you want privacy, use a corded phone dammit!!!

>vehicle could have been the thing that injured or killed him.

You're assuming that this guy only had the bike rider on his mind -
nothing else. That's a pretty poor assumption.

How many times do you read about reporters or tow drivers who caused a
fatal accident because they heard something appealing to them on a
scanner and went to check it out? Not very often I'd venture to say.

If you want to check it out - do it. Just make sure you are aware of
your surroundings and don't get in the way of the police. Hell, bring
a camera and make a few bucks off the poor reporter who didn't get
there in time. Also be aware that depending on who/what you are
following you could put yourself in harms way.

As long as those things are kept in mind - WHO CARES?

>>Here's a better solution: don't buy them.

Here's the only intelligent solution: perform your own independent research, and buy only when the dealer provides a satisfactory return policy.

I mean, if I had used the posts here as my only source of information, I would never had purchased a BC890XLT in 1995. But it's a fantastic machine - for where I live and for what I need to do with it.

The problem I see here daily is the repeating od old, non-first-hand experiences. And, as experts in the field like Bob Parnass will tell you, MY BC890XLT may have scores of circuitry changes and improvements from the initial production run - the ones that got the bad press reviews...although still labelled a BC890XLT.

> A "shorted cell" is more of vibration abuse than your electrical
> mentionings. NO correlation to the state of charge.
>....

Car batteries are usually lead-acid cells. NiCd cells work differently.
If one cell of a NiCd pack is weak, and you discharge the pack past the
point where the weak cell drops to zero volts, the good cells are
now running current in reverse through the dead cell trying to charge
it in the wrong direction. It's widely accepted that a reverse charge
will ruin a NiCd cell. I'll have to admit that I've never taken
NiCd cells and tried to ruin them this way, though. I've never heard
of reverse charge damage to cells in a lead-acid battery.

Just because something works OK on a car battery doesn't mean it will
work OK with a NiCd. Different beasts, different problems.
Also, lead-acid batteries don't have the memory effect that NiCd's
are claimed to have.

Also, if the cells in a NiCd pack are "balanced" in the sense that
no one cell runs down first, you won't actually do any damage by running
the pack down. You may get away with it on one pack and completely
ruin another pack.

i.e. Just because you've done it a dozen times with a particular battery
pack or group of battery packs doesn't mean the problem won't occur with
a different pack or even on the same pack as it ages.

It will also depend on the state of charge of the individual cells.
Assume you have a pack with one cell that has a higher self discharge
rate than the other cells. If you charge this battery, let it sit for a
few weeks, then discharge it through a resistor, you may get reverse
charge damage because one cell has less charge remaining than the other
cells. If you did this with the same pack with a fresh charge,
you might not get any damage because all the cells might run down at the
same rate.

Question: What is a simple, inexpensive, and convenient way to start
this year off in a FUN, intriguing, and romantic fashion?
(Santa must have been holding out on this one!)

Answer: Dateline!

Now that Christmas is over and you have given everyone else presents,
it's time to treat yourself to something nice.....that someone
special. Someone to share in your hobbies, your interests, your
lifestyle, your LIFE.

Dateline is the perfect way to find someone and be found! Dateline
gives you the forum to seek out others whom you find interesting, and
let others know about you! And the best part is - you are in control
of what happens. Call often to leave and receive lots of messages
(remember - this service is HUGE and there are so many people from
all the area codes across the country calling in to find people just
like you!), or call in as little as you like and leave and receive
a few selective messages. You can also call just once to see what the
heck it is all about. Whether you are a little shy or outgoing
in the biggest of ways - it is a simple and inexpensive way to find
other singles. It is amazing how much fun people have with Dateline!

It is so convenient! You can call in from anywhere at anytime to give
and get your messages. This is a 24 hour service and you just punch
in whichever area code you are interested in - whether it is in the
place you live or the places you go! And it is really super if you
relocate and want to meet up with guys and gals who share your
interests and would love to show you around! (No wonder Santa is
always so jolly - his sleigh phone has the Dateline speed dialed in!)

1-900-484-7009 ext. 5241

$2.99/min. Must be 18 years or older.

Serv-U (619) 645-8434

Make this your Happy New Year's Resolution: To call Dateline today
and start giving and receiving those personal messages! Join in the
fun - and don't keep those folks who want to meet you waiting until
next Christmas.....

Andy,

Sometimes I wish my folks would have stayed in Canada, they're both from Alberta, but they kept migrating south, ended up in Hawaii. I understand there is/was a movement in Ottawa that wants to ban cellular there too. Hopefully that was killed forthwith, how't that issue progressing?

Meanwhile, we see our personal freedoms being eroded one at a time by mis-guided lamebrain politicians here in the US. (Not that the Dominion doesn't have 'em too like everyone else).

Special interests, whiners, liars and "Me first" attitudes are to blame. We expect our Government to do everything for us what we once did for ourselves. Self discipline and self responsibility gone. It seems that this is where liberals have done the most damage, you needn't be responsible for yourself when the Government can do it for you.

Canada, U.K., Netherlands, and other countries have more personal freedoms than the United States, the once proud champion of personal freedoms. Sad, eh?

Envious in the US.

Jon

We had a Gerry baby monitor and had constant problems with the AC cord
until the entire unit just stopped working altogether. Even when it was
working we had lots of static noice in the background. We just got a
Fisher Price model and it works great. Even with the sender set on the
low setting we can pick up the signal very clear anywhere in the house.
The receiver is also so sensitive that we can pick up our neighbor's baby
monitor :-) Go with the Fisher Price it's worth the extra bucks.

As per my previous posts, I have a Toshiba FTH955. I think Toshiba and VTech are identical phones.
My Toshiba is digital 900 Mhz 10 channel autoscan (not spread spectrum), dual keypads, speakerphone and volume control on base and handset. It also has an intercom between the base and
handset that can even be used when you are on the phone ... you put the caller on hold then switch
to intercom then switch back to the phone. Works pretty well actually. 10 number speed dial, 5.5
hour talk time. 5 day standby. Good sound quality and range (about 600-650 ft in my tests).

I also own a UBC9000XLT.
Are there any other "special" functions for this scanner ?
Like : when set the scanner on, its goiing scanning and how to let the
light off ?

Any hidden key functions ?

Thanks

The National Speedtrap Registry (www.speedtrap.com/speedtrap/)has a
chart in their information repository.

Be aware that some cities and counties have their own laws.
More info on scanner laws can be found at:
http://www.afn.org/~afn09444/scanner/scanlaws.html

You could open up the radio, follow the output of the AC transformer past the rectifying diodes to the point they are soldered to the circuit board. Check the voltage and polarity. It's probably somewhere around 13-15 volts DC, in which case you're in luck.

You could tie onto those leads, install a coaxial DC jack on the rear apron, wired to bypass the diodes (so you don't blow them with excessive reverse voltage/current) when plugged into 12VDC, and Voila! I did this to a Pro-53 and a Pro-2011 with satisfactory results.

Is there a baby monitor on the market with a scrambling feature to
keep the neighbours from listening in? I've found that it can be
heard for at least two blocks in some areas by walking around with my
portable scanner.

> The first time I saw a post on this subject I thought I read the word
>"RIGHT" somewhere. I could be wrong. I still think that there needs to

You may have seen the word right, perhaps in my loose association with the fact that it should be a right but, let's face it, isn't. And police certainly need some control over their confident operations, so we can't have anarchist rights to listen to everything. I've used this point in selling local officials on the idea. I've only been talking about patrolcasts. Patrolcasts will be defined on my up and coming website in March, as I see it. But there is probably a huge controversy just waiting on that topic alone.

I am pressing open/proactive broadcasting on two fronts: the first as a social benefit. Police can build support and trust in their communities if they allow the average citizen to tune in on basic patrolcasts <not the sensitive communique that you are rightly concerened about>. I believe that it should be pursued as a component of community policing. If police understand this value, then no further discussion is necessary because they will actively come up with ways to keep open broadcasting alive, and later, come up with broadcast channels to the public.

Second but much less preferred, I am pressing it on the basis that we should not be forced to accept organized or "select" media accounts of incidents, which open broadcasting <and to a lesser degree proactive broadcasting> prevents. Police are willing to program radios to receive their patrolcasts for the media, but "who" the media is happens to be arbitrary, as is any set of criteria that you may theron rely upon. If one is happy subjecting themselves to the whims of their six o' clock TV news team, or the selectivity and limited resources, not to mention political pressures, of all corporate media forums, that's fine. I personally like an option to establish my own opinion and account.

I have to concede that the utlity aspects of either open or proactive broadcasting are tough. They should technically help the public avoid car crashes, pursuits, etc., as well as achieve some gain in helping to clear crimes - but just as many people "helping out" would overflow police inputs and negate their value. I don't think the utility aspect should be written off, but refined. The path to building the 9-1-1 system should be looked at as a possible model for proactive communication back to the public, and for overcoming some of the problems here.

There are laws, such as Florida's Sunshine Law, which *might* apply to police broadcasts. Dade County, Florida thought it might and agreed to program police radios for the public after a small challenge by organized scannerists who were prepared to cite the Sunshine Law. Personally I can see it going either way, but who knows. But the spirit of the Sunshine law is that average people do have the "right" to information about public matters.

These are very nice radios. They do exactly what radios in the FRS were intended to do. The nice people at Southern CE have pages on the radios. Try: http://www.southernce.com/

The lowest (non wholesale) price that I have seen is from SOG International; P.O.Box 590; Lebanon, Ohio 45036-0590. 1-800-944-4867. 8AM to 4:30PM EST. FAX: 513-932-8928 Their latest flyer (#71) has Sport 7 for $84.95 (two or more) and Sport 7X for $99.95 (two or more).

Enjoy, Mac

Bill,

Unless they are specifically rechargable lithiums, the answer is NO NO a thousand times NO! They can rupture, explode and cause all kinds of grief, bodily harm and besides, the Bio-Hazmat storm troopers might find out and break down your door and haul you off as an enemy of the environment and put you in the gulag with other politically incorrect undesirables!

Okay, I'm overreacting, but not about the storm troopers!

Best real advice: ask the manufacturer for a data sheet and a Material Safety Data Sheet (MSDS), that way you won't be taking any bad advice.

Regards,

Jon

Motorola Trunked Radio Control Channel Information

INTRODUCTION

There has been some interest expressed in the Motorola's trunked radio system data channel signalling format, especially as to how it relates to building a trunked radio scanner. The information in this file should enable any motivated individual to decode the outbound signalling words on the control channel. With this information and the appropriate hardware a remotely tunable scanner can successfully track individual talk groups. An example program listing is included that displays trunked system information with a simple op-amp interface that plugs into your PC's serial port.

Also, an minor explanation and correction to the error correcting routine for a program previously posted that receive Motorola mobile data terminal (MDT) transmissions is given.

This posting is basically a response to those people who expressed an interest in this type of information. Additionally, this posting hopes to dispel some of the excessive half-truths and arrogant flatulence which have created an unbearably asphyxiating stench on these newsgroups recently (i.e. he who writes things along the lines of "Only Uniden and I are smart enough to figure this out - piece of cake. And I figured it out FIRST, back in 1993. I have witnesses... I know Uniden STOLE the idea from me... You want a copy of the code? Just kidding... By the way, who wants to buy my trunktracker board if I get it built in the next 10 or so years?"). If you have information to share please do so without leaving out vital details and stop trying to impress everyone else with how little you know. If that's too much for you to handle then shut the fuck up.

BASIC PROTOCOL OF MOTOROLA TRUNKED RADIO SYSTEM

References -

1. K. Zdunek, "Design considerations for trunked radio systems," 36th IEEE Vehicular Technology Conference, (published by IEEE), pp. 194-201.

U.S. Patent # 4692945 covers the extended OSW format. Other patents cover such things as the error correcting scheme used (#4055832) and some of the basic transmission protocols (#4159469).

There was some file floating around several years ago about all the gory details of a TYPE I Motorola trunked radio system. It was originally posted by a certain Chris Wheeler.

When standing by, each radio sits and monitors the data channel waiting for programming information or an assignment to a particular voice channel. Programming information that can be sent to each individual radio can include (but is not limited to) talk group assignment, dynamic talk group creation, voice encryption key updates, date and time, deactivate the radio, new system frequency assignments, turning the radio transmit on (useful when the radio has been stolen), and of course a frequency assignment for voice communications. Here we are mainly interested only in the information sent out on the control channel (more specifically - which talk group is assigned to what frequency). Once we know which talk groups are active we can decide whether we want to send our scanner to that particular frequency.

The control channel modulation format is two level FSK at 3600 baud. In order to extract the desired information one must:

1. synchronize the receiver with transmitted data frames
2. Undo the Bit interleave
3. Identify and Correct errors using the error correcting code
4. Perform an error detection check to verify received data
5. Translate the received information into the desired action

The above steps are described in detail below. As an added bonus, the two level FSK modulation format means that a scanner's discriminator output can be sent to an op amp level comparator hooked up to your PC's serial port. An appropriate program can then send out tuning information to your scanner.

FRAME SYNC

One needs to figure out when a signalling word starts before one attempts to receive the information. Accordingly, between every 76 bit information frame there is an 8 bit frame sync byte which is allways the same. Synchronization is achieved by looking for this frame sync byte every 84 bits and stripping out the 76 bit frame for further processing. This frame sync byte is :

1 0 1 0 1 1 0 0

(Leftmost bit is transmitted first in our notation)

BIT INTERLEAVING

Reference: U.S. patent # 4159469

We have a total of 76 bits in each frame. Let us represent the received data stream as :

{1,2,3,4,5,6,7,8,9,10,11,12,...,74,75,76}

Before transmission the bits were scrambled into a different order so that adjacent bits are seperated by a number of other bits. Therefore, when an error burst occurs the erroneous bits will be spread out all over the data frame when the bits are placed back into the orignal order. The convolutional error correcting coding then has a decent chance of being able to correct all the erroneous bits. The bits in the received data frame must be read off in the following order:

{1,20,39,58,2,21,40,59,3,22,41,60,...}

Presumably Motorola does not expect burst errors of longer than four bits to be a problem.

HOW THE CONVOLUTIONAL ERROR CORRECTING CODING WORKS

Reference - U.S. Patent # 4055832 describes the ECC used for the motorola control channel signalling.

The code is formally described as a "Rate 1/2 convolutional error correcting code". Rate 1/2 means that for every information bit there will be one parity bit (therefore the information transmission rate is 1/2 the channel baud rate). The encoder calculates the parity bit by XORing the previous two information bits. The output then consists of alternating information and parity bits. If I represents an information bit and P represents a parity bit the data stream looks like:

IPIPIPIPIPIPIPIPIP....

Just to make sure we're all on the same footing the bits are tranmsitted from left to right. Now lets give an example of some information being transmitted:

Information. . . . . : 0 0 1 0 0 0 1 1 0 0 0 1 1 1 1 0
Parity . . . . . : 0 0 1 1 0 0 1 0 1 0 0 1 0 0 0 1
Transmitted bit Stream : 00001101000011100100001110101001

One should note that a '1' information bit produces a '1101' in the output stream. This property is additive - if one has a '1 1' in the information surrounded by zeroes the output will be '110100 + 001101' which is '111001'. This is called "convolution".

Great... Now how does one find and correct errors? The circuit described in U.S. patent # 4055832 does the following: 1) Take the received bit stream and recalculate the parity bits using only the received information bits to construct an "expected" receive bit stream ; and 2) XOR the actual received bit stream with the expected receive bit stream to construct something called the "syndrome". If all bits were received correctly then the actual and expected bit stream will match up and the syndrome will only consist of '0's. Let's follow this procedure for the above example:

Received bit stream: 00001101000011100100001110101001

Strip out Info bits: 0 0 1 0 0 0 1 1 0 0 0 1 1 1 1 0
Calculate Parity : 0 0 1 1 0 0 1 0 1 0 0 1 0 0 0 1
Expected bit stream: 00001101000011100100001110101001

SYNDROME : 00000000000000000000000000000000
(actual XOR expected bit stream)

The syndrome is all zeroes - no errors occured. Now lets see what
happens when we introduce a few errors in the received bit stream (the
bad bits have an * above them):

* * *
Received bit stream: 00001111000011000100001111101001

Strip out Info bits: 0 0 1 1 0 0 1 0 0 0 0 1 1 1 1 0
Calculate Parity : 0 0 1 0 1 0 1 1 0 0 0 1 0 0 0 1
Expected bit stream: 00001110010011010000001110101001

SYNDROME CALCULATION:
Received bit stream: 00001111000011000100001111101001
Expected bit stream: 00001110010011010000001110101001
SYNDROME : 00000001010000010100000001000000

Now there are non-zero bits in the syndrome: errors have occured. Now
one wants to figure out which bits were received wrong. Keep in mind
that one must distinguish between an error in an information bit and in
a parity bit. Because of the convolutional property the wrong
information bit causes the next two parity bits to be flipped. So we
look in the syndrome for two consequtive '1's in the parity positions.
Then we know which bits are wrong. Now let's say we have received a
parity bit wrong - then the syndrome will only have a single bit set and
we know the information bits are OK. So let's use the syndrome to
correct the received bit stream:

SYNDROME : 00000001010000010100000001000000
BAD BITS * *

Received bit stream: 00001111000011000100001111101001
Received Info bits : 0 0 1 1 0 0 1 0 0 0 0 1 1 1 1 0
BAD BITS : * *
Corrected Info bits: 0 0 1 0 0 0 1 1 0 0 0 1 1 1 1 0

And there we are! In this example we received two wrong information bits
and one wrong parity bit. We managed to identify and correct the wrong
information bits. The way we implemented things, the syndrome spots
corresponding to the information bits will always be zero.

This protocol is designed to be implemented in hardware using just
a few shift registers and sundry other logic gates. At the start of each
signal word the shift registers are reset to zero - one can think of the
an extra "phantom" zero information bit just to left of the first real
information bit. On the other end we add a flush out bit to make sure
all real information bits benifit from the error correcting. The total

number of information bits therefore is: 16 address bits, 1 Group flag, 10 command bits, 10 error detection bits, and 1 flush out bit: 38 total information bits. With the parity bits we get a total of 76 bits in the signalling word structure.

There are a few things to add at this point - a lot of bit errors means we might not be able to properly correct all of the received information bits. Even worse, errors tend to occur in concentrated bursts which would overwhelm this error correcting scheme. In the previous section we described the idea of bit interleaving to deal with burst errors. Finally, an error detecting code is described which is used to verify that the received information is correct.

- -

Somewhat off the subject side note:

Motorola's Mobile data terminal system uses a very similar rate 1/2 convolultional error correcting scheme. The only difference is that the convolution spans many more bits (specifically the parity bit is the modulo 2 sum of the most current info bit, 2 info bits back, 5 info bits back, and six info bits back). Error correction takes place similarly except one now looks for a 1100101 pattern in the syndrome (here the spots corresponding to the information bits in the syndrome have been left out). Such a detected pattern indicates the information bit that passed by 7 bits previously was wrong. The philosophy to be used is that if 3 of the four ones match that pattern one has an information bit in error along with one parity bit error (and if all four ones match up than only the information bit is wrong without any messed up parity bits). You can easily verify that the pattern 1100101 has at most 1 bit in common with any shifted version of itself - this means that if two information bits relatively close to each other are in error you will still have at least 3 ones in that pattern to alert you to the location of the bogus information bits. In this sense the error correcting code using for Mobile Data Terminals is somewhat more robust - it can correct two wrong side by side information bits which cannot be done with the scheme used for trunked signalling words. Some of you may remember a posting giving a program listing for decoding mobile data terminal tranmissions. The authors of that program unfortunately reversed the pattern being looked for so the error correction routine probably did more harm than good. The following code corrections should be placed in the last part of routine pork :

```
if ( (synd & 0x0001) > 0) nsy++;
if ( (synd & 0x0002) > 0) nsy++;
if ( (synd & 0x0010) > 0) nsy++;
if ( (synd & 0x0040) > 0) nsy++;
/* assume bit is correctable */
if ( nsy >= 3)
{
printf ("*");
synd = synd ^ 0x53;
```

```
line[lc - 7] ^= 0x01;
}
```

- - - - - - - - - -

And even more off the subject... Another minor error in the MDT program has been found in the serial interrupt service routine. The following line is correct:

```
if ((inportb(0x3fe) & 0xF0) > 0) dtick = dtick | 0x8000;
else dtick = dtick & 0x3fff;
```

The earlier version had an ^ in the above line instead of the |. This line takes the time increment between zero crossing and sets its most significant bit to reflect the state of the input line on the serial port. If the input line is 1 we want to OR the MSB with 1, not XOR it. This would only have been a problem if more than 130 1's in a row were received which means it would have had no practical consequence. Nonetheless, we believe the record should be set straight.

BIT INTERLEAVING

Reference: U.S. patent # 4159469

We have a total of 76 bits in each frame. Let us represent the received data stream as :

{1,2,3,4,5,6,7,8,9,10,11,12,...,74,75,76}

Before transmission the bits were scrambled into a different order so that adjacent bits are seperated by a number of other bits. Therefore, when an error burst occurs the erroneous bits will be spread out all over the data frame when the bits are placed back into the orignal order. The convolutional error correcting coding then has a decent chance of being able to correct all the erroneous bits. The bits in the received data frame must be read off in the following order:

{1,20,39,58,2,21,40,59,3,22,41,60,...}

Presumably Motorola does not expect burst errors of longer than four bits to be a problem.

FINAL CHECK - ERROR DETECTION POLYNOMIAL

We have 27 information bits and 10 error detection bits. This is the final check on whether the received signalling word is correct. Here's an algorithm that will allow let you check things out yourself:

1. Load some 10 bit register A with 0x36E and another 10 bit register B with 0x393

2. If the LSB bit of register A is 1 then let let A = 0x225 ^ (A >> 1)
Otherwise let A = A >> 1

3. If the first information bit is 1 then let B = B ^ A

4. Repeat steps 2 and 3 for all the other 27 information bits

5. When done register B should hold the same value as the error
detection code transmitted in the data frame.

If the error detection codes do not match up then you have an
uncorrectable error and you should disregard this data frame.

FORMAT OF RECEIVED INFORMATION

At this point you will have 27 information bits in the received
signalling word. We will define the first 16 as the "ID" bits. The next
bit is a flag indicating whether this signalling word is for a group or
an individual call - a '1' means individual, '0' means group. The next
10 bits are the command bits.

For some unknown reason you must XOR the ID bits with the pattern
0x33C7 and the command bits with 0x32A. Don't ask us why. It just turns
the commands and ID bits into those seen in Motorola literature.

The most common command is "0x308" - this means that this
signalling word and at least the next one are paired (see U.S. pat. #
4692945 where they even have $308 drawn in the first command register).
The second command register determines what this particular command
does. For example: if the second command is 0x310 then this means that
the radio addressed in the first ID field is assigned to the talk-group
given in the second ID field. Another example: if the second command is
0x322 then this is a time/date stamp (First ID: bits 9-15 give year;
bits 5-8 give month; bits 0-4 give day; Second ID: bits 8-13 give Hour;
Bits 0-7 give Minute; Bits 13-15 unknown) which is typically repeated
three times every minute. The second command field of 0x30B gives a pair
that is repeated every few seconds; function unknown.

Other commands can be things like 0x3C0 or 0x32B (again, functions
unknown). There are a huge number of commands that can be sent to
trunked radio; unfortunately we only know the time/date, talk group
assignment, and some of the frequency assignment functions. If anyone
could post a complete list of commands and functions then we will write
you into our wills!!!

The most important thing is the frequency assignment. The procedure
varies according to system type. However, we have found the following
formula tends to give reasonable results for most 800MHz trunked systems
operating on 25KHz channel spacings:

Frequency = 851.1125 + 0.025*(command XOR 0x004)

The talk group that corresponds to this frequency will be given in the ID part of the signalling word. Once we have the frequency we check to make sure it's in the appropriate range (for example, a frequency of 871 MHz would mean we probably misinterpreted a different command as a frequency assignment). Unfortunately you will still get frequency assignments in the proper band that do not belong to the trunked repeater system. To avoid having your scanner continuously jumping to a bogus channel you probably want to check each channel assignment with a list of valid channels which will greatly reduce this problem. Rumor has it that the new Uniden TrunkTracker requires you to enter just such a list for each trunked repeater system you want to monitor - presumably Uniden hasn't found an elegant way out of this problem either. On occasion you will get a frequency assignment pointing to the current control channel. In this case the ID in signalling word will be the system ID.

As you can see, trunked systems in the 400MHz and 900MHz bands (and some in the 800 MHz band) will use completely frequency allocation methods. Once again, will someone please post some real information?

Next, how does the ID transmitted over the air translate into talk groups? I'm not that sure, but I can make some general observations. The more significant bits correspond to larger and larger groups. For example, some hypothetical system might have the entire police department with ID's of the form 8xxx whilst the fire department had id's of the form 9xxx. Under the police department one might DL checks in the group 8090 and several precincts with the form 8080 and 8070. Then some tactical channels might be of the form 8380 and 8370. Kind of messy, but the important thing is that you can easily identify which talk-group is used for which purpose without knowing every last detail of how the talk-groups are structured.

A FEW WORDS ABOUT THE PROGRAM

The only program option you have is to reverse the received data stream polarity by including a command line arguement (e.g. type in "name X" to start the program with reverse polarity). Other than that the program either works or it doesn't work. The program expects to see the interface on the first serial port. If you don't like it you're certainly welcome to rewrite the program. Now what kind of interface do you need? Well, here's something from a previous post about mobile data terminals:

>COMPUTER/SCANNER INTERFACE
>
> Those of you who have already built your interface for decoding
>pager messages should be able to use that interface without any further
>ado. For those starting from scratch - you might want to check out
>packages intended for pager decoding such as PD203 and the interfaces
>they describe. The following excerpt gives an example of a decoder that
>should work just fine (lifted out of the PD203 POCSAG pager decoder

```

```

As it says, use the discrimator output on your scanner. Check things out with your handy-dandy PD203 POCSAG pager decoder package.

Compile the program - I know it works with Borland C compilers. And don't run it under windows. If it works you should see frequencies popping up on the left side of the screen along with active talk groups. The call type is given the G/I flag. On the right hand side you'll see various system housekeeping information such as the date and time (don't set your watch by their indicated time). And that's just about it.

Oh yes - the calculated frequencies work only for some 800MHz trunked radio systems. If you have a different system the frequencies will be really screwed up. If you figure out the proper decoding scheme for other systems please post your results. On the display your real frequencies will be mixed with a handfull of bogus frequencies - it's up to you to sort them out.

HOW DO I GET THE PROGRAM TO CONTROL MY SCANNER?

1. Connect your serial port output to your scanner (with a level translater if necessary). The program includes some vestigal code that allows you to send information out over the RS-232 port (send_char routine). Routine send_char is simple, stupid, and reliable. There is more information in the program comments about how to configure the desired baud rate, parity, and word length. Don't try to use the computer's built in BIOS functions - they will get horribly confused by all the strange things happening on the serial port's interface lines.

2. Monitor the OSW data stream. Whenever a talk group pops up that you want to follow tell your scanner the right frequency to go to. You will probably want to make a list of valid frequencies to keep your scanner from continuously bouncing to a bogus frequency.

3. You don't want to continuously listen to the trunked data channel or you will go insane. Solutions? Send the audio through your sound card and mute it where appropriate. Use a computer controlled relay to switch the sound on/off... Whatever...

4. The next problem for a real user friendly trunking system is how to detect when the tranmission on one particular channel has ended. It's a real pain when you have to hit a key to send your scanner back to the control channel. Solution? Take advantage of the sub-audible signalling sent while the channel is active. This will be a 21 bit frame that has sync data, ID information and 2 parity bits sent at 150 bauds - "low speed handshake". At the end you have a 200mSec burst of disconnect tone (163.64Hz). Either of these could be taken advantage of. Even better, why don't you pull the squelch gate signal out of your scanner? If you do that then you're all set - send this on to the computer and let it tell your scanner when to return to the control channel. Your scanner would now be a simple hands off trunk tracker.

FINALLY THE PROGRAM LISTING ITSELF

Okay folks, this nonsense has gone on and on with nobody offering anything but "I've used enough Ni-Cads to sink a battle ship", or "I use tons of 'em in race cars" or any other number of "Oh yeah? Well I've used more Ni-Cads than you" statements.

Fact is, just because someone uses them by the shitload doesn't make them an expert. The electochemical reality is what the issue is. Identifying what actually goes on inside of a Ni-Cad helps settle the argument of whether it's actually memory effect or if it's some other phenemonon mistakenly called something other than what it really is.

What goes on inside the battery is gassing, small gas bubbles building up on the plate (nickel hydroxide). By 1990 or so, most consumer Ni-Cads had been designed with internal venting to dissipate this gas buildup.

Many commercial application Ni-Cads use external venting, but consumer Ni-Cads need to be sealed to prevent leakage.

Gates Battery, NASA, Motorola, and many others have published information stating that the memory effect is a myth, miscontrued from improper charging and discharging methods and other symptoms. Yet the myth continues because some people apparently know more than the Engineers who developed Ni-Cads and other experts who have published this subject in painstaking detail many times.

The bottom line is, "memory effect" was dubbed in error.

Read Mobile Radio Technology, it's THE trade journal for people who are in the Land Mobile Radio and Cellular business. Read "Nickel Cadmium Battery Application Handbook" published by The Gates Battery Co. Gates Engineers are THE experts in the development of Ni-Cads.

Read, read and read! If you still believe in old wives tales like memory effect, then you're just plain stubborn I guess. Argue with them, not me.

Sounds like it's time for a new keypad (it also took a dump in my -43).
Check Tandy's tech support page <http://support.tandy.com/> to find the
part number and order a replacement from them. It's fairly easy to replace
if you've had some time with a soldering iron.

I just picked up a RS PRO-2037 scanner from a RS outlet. It seems to work OK but I pick up 162.550 mhz (weather) on 161.190, a RR channel.

Is this a quirk of this unit or should I take this sucker back to the outlet store?

About a week and a half before Christmas, I went to a local RS to check out the Pro-60. A new guy, perhaps his first day on the job (you know, seasonal salespeople) asked me if I needed any help. I told him I wanted to see some scanners, so he went behind the counter where they're kept, and I stepped to the front of the counter. At first he pointed to a shelf of mini-cassette tape recorders and asked me "which one?" I pointed to the scanners that were on the next shelf over. The scanners were all "free-standing" on the shelf. After reading the labels, I asked to see the Pro-60 that was at the very end of shelf. Not knowing the scanner was secured to the shelf by a 1 1/2 foot long wire, he picked it up to hand it to me, but the wire caused it to slip out of his hand. In an attempt to catch it, his arm instinctively flew up and out, which hit the next scanner on the shelf. *None* of the other scanners were secured by wire, so a domino effect kicked in; all 5 or 6 scanners fell off the shelf, but the salesman mananged to "wedge" one of them (Pro-26?) between his body and the shelf. 3 of them landed on a cabinet below the shelf, and the others bounced off of it and landed on the floor. At this time, the manager piped up and asked me "whaddaya wanna know about the scanner- its "frequency response?" (I'm sure he meant "frequency/band coverage.") I replied "yes," to which the manager told the salesperson "always use the catalog. All of the specs are in there. Never show customers the radio." Needless to say, I didn't buy a Pro-60 at *that* RS, but did buy one later elsewhere.

>And a sincere newbie question, Steve: Why does living near police/fire
>call for triple conversion?

Living near any transmitter means you're in a high level RF
environent, which may swamp a scanner and cause excessive imaging
and/or intermod. Triple conversion reduces the extent of these
troubles.

Mark

The truth as I perceive it to be.
Your perception will be different.

There's a good chance they are not referring to ebody else's channel 16,
as we would know it. It is probably some frequency which they call
channel 16, but it may not correspond to channel 16 of some other
service.

955. McDonalds on 105.1 FM

Newsgroup: rec.radio.scanner
Date: 1997-02-08 00:00:00 UTC
From: Steve Fleckenstein <spfleck@warwick.net>
Message-ID: <32FD41B3.7CB6@warwick.net>
Source record: 208330

I was sitting in the parking lot of a McDonalds in Middletown, NY flipping around the dial of the AM/FM radio in my wife's 88' New Yorker. All of a sudden I hear engine noise on the radio.. then "Welcome to McDonalds, Can I take your order please?" I look at the digital readout on the radio.. 105.1mhz.. Must be an image. Perhaps someone else out there can do the same.

Steve - N2UBP

Consumer Reports didn't review the V-tech phones for whatever reason.
I bought a V-tech two line recently. It is secure and has good range
etc. Digital takes dome getting used to however because you dont get
any static when you get out of range, the line is just quiet.

Hello,

Does anybody know a good program for DTMF and than for a 486DX4 ? I've
got now a program that's to slow on my computer it's made for a
Penthuim.

The same for a MORSE program, I'm looking for a program that undecode
MORSE signals...

So if anybody know such a program, please send me a E-mail...

Thanx

That's interesting. It means some enterprising wag at one of the
stations with helicopters had figured out OJ's freq and jacked it
into the right channel. Great stuff, but I don't understand why the
networks had the right to use it during the civil trial, just because
it was introed into evidence. Could someone explain that to me.
Just becauase its evidence doesn't make it for public consumption.

You can listen to anything you want in any state in the union. You
can't tell anyone what your heard, because there is a federal penalty
for that. There is also a question of what you can do with it. If
one person gives you permission to use it, the tape can be introduced
as trial evidence in Wisconsin. A radio station can put a tape on the
air if it gets the permission of the taper and the tapee. If they are
half of that, they only have to get permission from the tapee. In the
early days of home portables there were many cases of police busts
using reports from home portables as evidence in court. I think that
is still alright, though it would seem to be on a collision course
with the 86 federale law prohibiting the divulging of any infor heard
on a portable call. Probably, this little inconsistency has not been
tested in the courts. If we civilians can't tell anyone what we hear,
why should the cops get special dispensation to blab it as evidence
in court.

I once heard a guy with a stolen car calling his girl on the
cellular he found in the car, and bragging about it. I called
the local phone company which had a cellular subdivisiion,
but the operator there had no specific instructions about what
to do in such a case, so she did nothing about it. I'll be damned
if I would call a law enforcement organization with the information.

Okay, here's the scoop. The viewing angle of your LCD display is determined by the angle of the light source. My suggestion to you is to turn the LCD illumination off (SHIFT-3) and use your own light source, such as a gooseneck lamp. This will also aid you in viewing the controls at night.

969. What scanners are still available that can be modified to p/u cellular

Michael,
Get the telescoping antennae at RS. It is 10 times better! It's a
two stage, metal with a black slide piece in the middle. It's fairly
cheap as I remember.

WRONG, I brag "I can do that, I'm a super bitchen cop... and you're not".
At least get it right, K?

> Your the kind of cop I like to go to trial with because you don't
> know a thing. Most of your cases get thrown out because you thought you
> could pull over someone because he 'looked suspicious'. You probably
> can't define suspicious. Your the guy who joined the department so you
> could put a pretty light on your dashboard.

I guess that's why I made T/O after 3 years of patrol eh?, and Detective
shortly after that.... must be all that "nothing" I know. I can tell
listening to a scanner has plugged more law enforcement knowledge into your
brain than all my years of police work. Ask the people I've put in prison
about the cases that got tossed out too, and yes I will stop someone if
they look suspicious. I can write one little sentence to justify stopping a
suspicious person, know what that might be??

> Before I go I would like to remind you that without the public,
> police would never solve a crime. After all, we provide most of the
> evidence in an effort to assist.

Prove this, I bet you can't. I've investigated many crimes with NO help
from the public. You want to know the honest truth?.. 90% of the time you
"public" types make rotten witnesses, and do awful on the witness stand in
court. I've seen clever defense attorneys destroy an honest citizen who
just happened to be a witness to a crime. After this lawyer got done with
one of my wits, she did'nt know what day it was much less who caved in the
head of the poor sap next to her in the ATM line. I had a shooting at a
crowded bar, must have been 50+ wits, I'd say 30 of then gave totally
conflicting versions of what happend, most could'nt even agree on the race
of the suspect. Save your block capitan shit for someone who cares.

> The 'Good Citizen' (or 'idiot' as you see them). One word of advice,
> pull your head out of your ass and you may see the light.

Do yourself a fovor, read the posts carefully before deciding to just spout
off at the fingers, you'll look like less of fool that way. NOWHERE will
you find me making a reference to "Good citizens" as "Idiots", quote me if
you can, K?. I was refering to the "Idiots" that blocked the freeway, stood

in the street, followed in thier cars and otherwise got in the way during the OJ "slow speed chase".

> Until then, get over your God complex.

No, it comes with the badge. So there, na naaa naaa na na naaaa

> I am not alone. As long as
> there are people like you, there will be people like me to make sure you
> don't get out of line. Your a cop, and you still work for me!

I pay taxes as you do, thus as far as I'm concerned I'm self employed, and please by all means glue your Radio Shack scanner to you ear and listen to me do my job, better yet get some alligator clips and clip the earphone wires to your gonads, I'll park infront of your house and key the mike, maybe that will assist you in obtaining your jollies (wear a slicker or something). Bottm line I DONT GIVE A RATS ASS if you listen or not, if you follow me around (Like some scanner buffs have been known to do) stay out of my way.

I believed as you, my mind might be changed soon. After looking I found the plans for an MDT decoder that interfaces with your PC, my friend and I are obtaining the parts to build one for training purposes, If it works I'd love to show my supervisors the system can be hacked.

I paid nothing for the plans, look and ye might find.

[big snip]

Your otherwise well reasoned letter would be more compelling if you
knew how to spell ridiculous. That repeated misspelling was so jarring
as to detract from your message.

Now I don't normally engage in spelling flames, but when it hurts the
effectiveness of your message, you've got to become more conscious of
it. Letters to Congress are one area where it does hurt.

In what country?

>If so has anyone got comments good or bad???

Good receiver section. Relatively clean of intermod. Scans too slowly.

Missing a lot of features, and many others are implemented bassackwards.

Some are merely annoying (for instance there is no way to simply press a
button and turn on the dial light once. Or that pressing the MONITOR button
to open the squelch freezes every thing else - so you can't tune).

Some are more annoying (try removing the alpha tag from a scan bank AFTER
you've erased all the channels in that bank .... grr.....)

Some can be fatal (Can't link scan banks together. They've REMOVED the
up/down arrow keys!).

Some come in the guise of feaures (like the AFC, which pretends to do what
the Uniden/GRE patented center-track tuning does .... but it doesn't).

>Time for a new toy!!!

Try the Yupiteru MVT-9000 ... or Alinco DJ-X10 (coming real soon.)

Nice views on audio scanning, but hey! What about video
scanning? It is much more fun. A wireless receiver and
you are James Bond. Many businesses use wireless video
for security, and it is starting to get into homes.

Any ideas here?
Have fun.

Read this, and it could change your life forever!!! Save it as text if
you don't have time to read it now!!! Or print it out to read later!!!

> > How much do you spend on lotteries?? >
> Have you ever won??? >
> I saw an article in an internet newsgroup telling me I could make >
> $50,000 within a month for an investment of only $5.

Who'd believe that??? It's a scam, right? WRONG!!!!!
I thought it was a huge joke so I rejected the idea at first.
After a period of about 2 weeks i figured, what the
hell, what's five dollars gonna hurt??

So I gave it a try. Two weeks later, I began receiving money in the mail!
I could not believe it! Soon hundreds and then thousands of dollars began
to roll in,
right in the mail!!!!!

Within 4 weeks, I had recieved a total of $30,000!!!
It came from everywhere in the world.
My bank account has changed its "-" to "+++"!!! I bought my
self the car that I've always > > wanted, a
brand new computer, a stereo system, stuff for my kids, etc... If you
follow EXACTLY the three steps below, there is no reason why the same
thing shouldn't happen to you. You invest $5 and you recieve a

return of muchos $$$$$ on your investment. So does the next investor.

THIS IS ABSOLUTELY LEGAL, NOT A CHAIN LETTER -- PERFECTLY LEGITIMATE.

If you are not interested you don't need to read on any further (why you
even
read this far confuses me!!). But please, if you are interested, then
print this article out and then pass it on to someone who may be
interested so they can take advantage of this offer as well.

THE PROCEDURES ARE:

STEP 1:

Write your name and address on five sheets of paper. Below that,
write the words "Please add me to your mailing list." Fold $1 note or bank
draft in each piece of paper and mail them to the following 5 addresses:

1. George Kemp
1819 Home Gate Dr.
San Jose, CA 95148
USA

2. Barry Pope
650 Old Fannin Road #D-9
Jackson, MS 39208
USA

3. Bernie Villarreal
1605 Thorn Street
Chicago Heights, IL 60411
USA

4. Alain Recht
1, rue de Gasperich
L-5826 HESPERANGE
Luxembourg Europe

5. Chrisi R.
Schulgasse 6a
A-2183 Neusiedl/Zaya
Austria
Europe

STEP 2:

Now remove the top name from the list and move the other four names up.

In other words, #5 becomes #4 and so on. Put your name as the fifth one
on the list. Use a simple text editor such as NotePad (in Windows) or
DOS editor. In fact, any editor will do.

STEP 3:

Post the article to at least 200 newsgroups. There are 17,000, so it
shouldn't be hard at all to find 200. If you're using Netscape News,
right-click on the yellow folder, and then click "Show All Newsgroups".
It will take a little while, but when it's done, right-click on that
again and then click on "Show All Newsgroups". Try posting to as many
newsgroups as you possibly can.

THE MORE YOU POST, THE MORE $$$ YOU WILL GET!!!

and the bigger the newsgroup is, the more people are likely to
see your message.

YOU ARE DONE. NOW SIT BY THE MAILBOX EVERYTIME THE
MAILMAN/MAILWOMAN COMES AROUND!!!

CONGRATULATIONS, IT DID WORK, DIDN'T IT?!?!?!?!?!?!

You are now in the mail order investment business, and should start seeing
returns within a week or two. Of
course, if you wish to be anonymous, you could use any name that you

wish or use a title like "The Manager" or "The Boss". It doesn't matter what you call yourself, just make sure that the address is correct!!

Now here is why the system works.

-- Of every 200 posts i made, I recieved 5 responses. Yes, only 5. You make $5 for every 200 posts at #5.

-- Each person who sent you $1 will now also post 200 additional postings on newsgroups with your name at #4. ie. 100 postings. On average therefore, 50 people will send you $1 dollar with your name at #4. $50!!!!!!

-- Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return of 500 people = $500. They will make 200 postings each with your name at #2 = 100,000 postings-5000 return at $1 each = $500.

-- Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name is dropped off of the list.

AND THAT'S IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS!!! Total income

one cycle = $55,000.00

From time to time, when you see your name no longer on the list, take the lastest posting that appears in the newsgroups and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guidline. The more you post, the greater the return is.

Let's review why you should do this.

THE COST IS ONLY $5, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $5
for such an effortless investment with such spectacular returns.

Some poeple have said to me, "What happens if this is played out and no one sends me any money?" Big deal, so you lose $5 but what are the chances of that happening?? Do you think that NOBODY cares about legal

chances of making such BIG money as $50,000.00???? And all for a microscopic investment of five seperate dollars??? Just think of all the Internet users that join the net everyday!!!!

There are millions of internet users worldwide, and millions of new net surfers every
month!!! This is the great plus of the new Internet, people all over the world can hear you and will listen carefully if you talk reasonably. Everyone will take that chance!! I agree, if it wasn't for the Internet, and it was a small circle of people, the chance wouldn't have been so small. The amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here on the Internet,

it is a giant village, where thousands of new members join everyday!!!

You CAN'T lose!!!!

Remember - read the instructions carefully and play fairly.
That's the only will this will work. Get a printout so you can
refer to it if you need to. Try keeping a list of everyone that
sends you money and always keep an eye on the postings to make sure
everyone is playing fairly. You know where your name should be. If they
don't play fairly, than you shouldn't include that person's name on
your list of five.

REMEMBER, HONESTY IS THE BEST POLICY, YOU DO NOT NEED TO CHEAT THIS IDEA
TO MAKE MONEY!!!
BESIDES, NOT PLAYING FAIRLY IS ILLEGAL.
SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY
THE INTERNET GOLD MINE!!

GOOD LUCK FOR YOU ALL, AND REMEMBER, PLAY FAIR
AND YOU'LL WIN, I don't

wanna mention what will happen to those of you who don't.

AND AGAIN, SEE YOU NEXT TIME WITH SOMETHING YOU'VE WANTED
FOR A LONG TIME!!!

P.S. If you don't feel like typing 200 articles
for 200 newsgroups or your typing is slow, why not save this article
and then once your on the newsgroups, use a text editor to open this
file and then remove #1 and the make #2 to #1 and so on and then save
the article for the next post.

Then click on "Edit", then "Select All",
then "Copy". Switch back to the newsgroups, and when you post, click on
edit and paste, now there's your article. No need to type up the whole
thing. Do the same thing to 200 newsgroups.

Oh I hope this isn't the beginning of a great ham v. scanner debate. However, I definitely find myself reaching for the scanner more often than the HF rig, which usually rewards me with static and hiss at night, the only time I have to listen to any radios. I think the police, fire, and aircraft are much more exciting than signal reports, if and when the bands are ever open. Scott, AB5YD.

Catalog points out that three scanners usually listed
for $299.99 :

1) Pro-62
2) Pro-51 - this usually goes on sale for less than $199 tho
3) Pro-2037 - triple conversion unit that is suppossed to be
the base version of the Pro-62. Everything I have heard
about this unit is good. Bob Parnass review says it is more
prone to intermod and images due to "inadequate front end
filtering".

There is no memory effect. It is a myth.
What you observe is caused by over chargeing the battery.
By completely discharging the battery, you are only insuring that you don't over
charge it.

Jorge.

It depends on who's asking the question. If you're a hobbyist like most of us, the answer is, yes Scan-Cat Gold can restore the missing cellular band, no tricks or foolery. Scan it directly in 30 KHz increments.

If a politician, mainstream media reporter or CTIA member asks, the answer is "!@#$%# OFF!".

Happy scanning,

Jon

1001. PRO-43 keyboard problem

Newsgroup: rec.radio.scanner
Date: 1997-02-08 00:00:00 UTC
From: KD8X <kd8x@ibm.net>
Message-ID: <32FCBC86.4228@ibm.net>
Source record: 208412

I have a Pro-43 scanner that is 3-4 years old. I have problems getting the keypad to work. This problem seems to go away if the scanner has been on for a hour or so. My guess is that it is just getting worn out. Have any of you Pro-43 owners experienced the same problems? I have made no mods to the scanner and really don't think I want to get "inside" it but do you have any suggestions? Certain keys like the "3", "1", and "scan" keys are especially stubborn. Please reply via this newsgroup and thanks for your input.

Which part applies to restricted listening?

> I admit it was some time ago, but I do remember reading reports in the Ottawa
> papers of a case involving "illegal operation of a scanner" - must have been
> breaking a law to be illegal.

Well, I don't recall it. Not that Newspapers lie, bend the truth or
make mistakes. <G>
It's possible that the culprit used a scanner to listen in on the police
or something while he planned a bank heist.

> There are very definite restrictions on disclosing what you hear. It is, for
> example, illegal to tell anyone what you heard on CB, unless you were a
> participant in the conversation in which event you might make a case in your
> defence.

Or the transmission was of a broadcast variety. My apoligies, you are
correct and I missed this point. I was just thinking of whether there
was anything that Canadians can't legally listen too.

> Some of the Canadian restrictions on listening have even found their way into
> the criminal code. It is just that we generally don't get as excited as our
> neighbours over these things, and there are very few prosecutions.

Please cite one example, Dave.

Cheers!

The problem here is that Canadians are paying for services to American providers. The cable companies in Canada are very powerful (unfortunately) and don't like the Americans eating in on their business. There are plenty of satellite dishes around though. It's the pay-for-play ones a la SkyTV etc. that are illegal dubious here.

Cheers!

I've never seen this band used for cordless telephones - anywhere in the
world.
I've seen many others - but never this one!

> The other possibility is a person who is using a phone patch on ham
> equipment
> off the band... how far are you from Jersey City?

And yet another possibility is that it is the output of a commercial
land-mobile repeater system that happens to have a phone patch
installed.

Of course, it would also be an image frequency.
Cheers!

Probably not. Uniden is an offshore manufacturer anyway, and if they
develop for the US market (the vast majority of all scanner sales in
the world), they probably won't bother making a special model for the
few other areas that might want the capability. Most people who buy
the trunk tracker won't be buying it for cellular phone listening, so
why put any effort into making it cellular capable?

Source record: 208433

I am sick and tired of you scanner criminals being able to
listen in on my phone calls. I am therefore proposing legislation
next month that will make the possession or use of any
scanning radio device, plans or schematics for said device,
literature describing said device, and any newspaper, book,
or document describing said device a Class 2 felony,
punishable by imprisonment in the suburbs of Cleveland
for a period of up to 10 years and a fine of up to $50,000.

In conjunction with this new federal regulation, all
subscribers to this newsgroup are ordered to return
their scanners to the place from where they purchased
them. At that time, a uniformed representative of Your Federal
Government will seize the scanner and provide to you in its
place a copy of my book. And, you don't even have to plug
in a book or rig a complicated antenna to enjoy it.

So there. Take that, Gary Trudeau!

Your friend,

Newt

I just bought an AT&T 9001. It sounds good and has about 10 times the range of my old analog 10ch cordless. Consumer reports gave it a good rating...and supposedly the range is 800ft. It's digital and *secure*, that's what I like about it. Talk time is 5.5 hours with a 5 day standby.

Though I hate Incredible Universe, they now offer it for $109. I suggest buy somewhere else and get them to match the price. Good luck deciding.

>The TH-79 and IC-W32 have independent volume and tuning dials for the
>two bands. The others only have one dial.

How about the "scan on one frequency, track at a specified freq
difference on the other" question? If the unit had two independent
scanners running in parallel at the same speed that would meet my
needs. I could set each up to start search at a different frequency
and if the scan rate was identical then they would track at a fixed
distance (of course, locking on a signal on one should also stop the
other for this scheme to work).

>Over in the UK, the FT-51R is the most expensive of the lot, followed
>by the TH-79. The IC-W32 is not much cheaper either. The DJ-G5 is a star,
>because it's packed with features and is the cheapest of the lot.

I hope the DJ-G5 appears on Alinco's web page. I'll take a look.

>>Also, is it possible to pre-program the 1st receiver to search and the

Dear Vartan: take it easy...(No need to get upset...:-)
(I always say: tame your flame...:-)
Many times there are problems on our news group server, or I'm too busy to monitor all the newsgroups I've posted in. An email simply serves as an "alarm" to check the newsgroups as well as a safety measure should my news server not be up to date. For me, sending an email in addition to a post is easy: just one key press (up arrow while composing the followup posting). I always do it automatically. Maybe you should try Forte's Free Agent that I'm using?

Anyway, I'd like to thank you for your comprehensive response. I'll take a look at the products you mentioned (some already known to me). One more question: which has the fastest scanning speed?

regards,
techno

(P.S: When responding, please email directly in addition to posting here, since our news server isn't very up to date. WEll, then you can do as I do when I go into an
Auto Parts store... I have a form printed out which
I fill in prior to going in for a part....I call ahead
to see if they have it....make notes of part number and
things like that.

Fill in the form: Just a little one.

It states:

I NEED A PART FOR MY JEEP

``````````` Year of Jeep:
Model:
No. of Cylinders:
cubic inches:
Auto Tranny:
Air Conditioning:

Part Wanted:
```````````

My DOS program KEYFORM produces these about six to a page
and I print up two pages and keep them handy in Jeep for
when I need parts.

Going into a parts place can be very angst-ridden. They
are forever asking you :"what year was that again?"

some see this form and get in an emotional HUFF. Very
easily. They dont' know what to do at first with it.

The humor about going into RS lately is this:

i wanted to know about their Scanner They had on sale.
The 50 channel one.

I stated I wanted to see the 50 Channel Mobile Model
scanner which I am told is on sale.

I quote him: "do you have the model number?"
And proceeded to access the RS computer while awaiting
my answer. I said no.

he then said: "what is a scanner?"

Seems that each time you go in you are expected to know
the model number before they can THINK about your needs.

Wow! That sure was a lot of trouble to go into!...(I was thinking
about such a solution but it seemed like too much work was needed -
'kinda placing a logic analyzer on the CPU data bus...:-)
So the CE-232 interface probably fits only the PRO-2004/5/6 scanners
that probably use the same LCD display controller. Serious limitation.
How about all the other scanners in the market? Do they use direct LCD
drive from the main CPU? Isn't there a pin on most CPU's that
indicates that the frequency was just increased by the amount of the
frequency step?

:

LoJack units are small micropressor-controlled radio transceivers
purchased from and installed by the LoJack Corp in a secret location
inside a vehicle. Each LoJack unit has two unique and unrelated secret
codes, an activation code and a reply code.
When a victim reports their vehicle stolen the investigating agency
will enter the vehicle into the NCIC/local state computer system.
This system will send the vehicle VIN, year, and make to the LoJack
computer located at a local police facility and this system will
determine if the vehicle is equipped with a LoJack. If there is one
the LoJack system sends out radio signals to activate the LoJack
unit in the stolen vehicle. When the LoJack unit is activated it broadcasts
a reply code periodically. If a police vehicle equipped with a police
tracking computer (PTC or Tracker) picks up the signal from the stolen
vehicle a 5 character reply code will be displayed on the tracking device
display screen in the police vehicle.
By querying the LoJack system with the reply code the police can:
1. Obtain basic vehicle identification info so the vehicle can be
recognized when encountered.
2. Determine the vehicle status and further useful info from secondary
queries of the NCIC wanted vehicle files which the system generates on the
basis of the vehicle ID provided by LoJack.
3. Get the system to speed up the LoJack unit's broadcasts temporarily
making it easier to track. When the vehicle is recovered and the vehicle is
cleared from the computer the LoJack computer will send out radio broadcast
signals to deactivate the LoJack unit in the recovered stolen vehicle.

your do make a good point i have not seen an assault wepon since being in the millitary. More over not that many people are killed by these type weapons in the usa. BUT handguns kill a bunch i believe it was 1993 when the justice department released these figures USA had 14,000 hand gun murders with 260.000.000 population japan with 1/2 120.000.000 people had 94 handgun murders. It also has No Death penalty. The Usa is is a fine group of nations that still use the death penalty North Korea, Red China,Iran,Iraq, Saudia Arabia, Libya you get the picture. I am a left winger but you do make some valid points and I at least respect your opinion.

Ha! The media will just portray us concerned Americans as rightwing anti-govt eavesdropping hate monger supremecists. What the people need to see on the news is all the eavesdropping govt agencies are doing on private citizens in the name of National Security. I'm not talking targetted interception but random monitoring of cellular, etc. The cold war didn't end, the efforts were just turned 'inward'.

Pager transitter antennas have power outputs of 5000 watt ERP in urban areas. Considering the average public service antenna transmitts under 300 watts ERP and you have dozens of pager towers in a small area, the intermod products are going to get into any front end of any scanner, etc.

Go down to your local Goodwill or Salvation Army and look for any of the Fisher Price units. They are the best, and are usually available there for $5.00 or so. The technology has not changed any, so ones that are a few years old are fine. Make sure the portable "parent" unit has a jack for an AC adapter, otherwise you will be going through a 9V battery every few days!! (or get rechargeable "9V" batteries).

A unique monitor, if you can find it, is the Gerry "Two Way" monitor. It is in a funky tan case with brown trim and blue control knobs.

Both the "baby end" and the "parent" end can be powered from AC or batteries. The unit also has the unique ability to transmit *back* to the baby unit. It also has a LED "level meter" display to grab your attention in noisy environments. If you run across this particular Gerry model, GRAB IT!

Please remember that these units share the same channels as cordless phone handsets, so occasional interference can occur. Usually the phone will switch channels if there is too much interference. Also remember that the unit is transmitting *everything* that is said or done in your house to the outside world. Turn it off when not in use (and don't discuss anything about Newt!).

> As more and more people use cell phones, including those who take them on hikes in the mountains (as is the case in WA state), the ability to do direction finding on persons in need will go down. Direction finding equipment requires a radio that can receive.
>
> Any more ideas? Then, put these into a letter to your reps.

The counter-argument could be made that the Search and Rescue squads, if they are part of a "legit" agency, could qualify for unblocked scanners. Hey, if you turn down the volume and just watch the S-meter, is it legal to intercept??

On a somewhat related subject.. ;^)

Has anyone *heard* excerpts of the "tape"??

Are "snippets" (.wav) of the tape available anywhere??

We all know what noises scanners, cars, recorders, and old couples in cars make. Can any of these noises be heard in the tape?

It seems anyone even *slightly* familiar with scanners could tell, in 2 seconds or less, whether the tape was made by placing the recorder next to the scanner, or if it was made with a direct connection to the phone line.

These questions have been "Gnawing" at me, since I missed the TV interviews, and this information is lost in the transcriptions.

If anyone taped any of these interviews, is there a section that includes a portion of the tape? Could you make a .wav of it?

Ugh!..Where's my Tylenol.... >:^/

Sean, I hope that 'up the street' isn't the Radio Shack Super center in Garden Grove California. If it was, I think I got your radio :). The Super center has a clearance center with freight damaged, returned, and refurbished merchendise. Last week I went in, and was told the same thing - that they were getting stuff from four stores that had had water damage. He didn't know when the stuff would come in, but there might be scanners in them.

I went in today, and he had two hand-helds. A Pro-70, and the other was a Pro-62. I have been waiting for a SC150B to come in from Damark, but they have been backordered until the middle of March. The Pro-62 is now on sale for $199.99, and the supercenter had it on clearance for 40% off of that price ~ $120.00. The guy said that if I applied for, and put it

on, their credit card, that he would knock off an additional 10%. I told him that I don't believe in credit, I declined the additional $20.00 discount. He then told me that if I bought their 5 year service program for $60.00 he could drop also do the 10% discount. I figure that if the radio is going to fail, it is going to fail within the first 30 days of using it, when I can still return it.

After talking to him a bit, he decided to let me have it for the $99.99 price. Since the SC150B I have been waiting for was going to be $150.00, and this was twice the radio, I jumped at the opportunity. In addition to the radio, I got a power converter - at 50% off - and a dozen batteries. Out the door, with tax include, the radio and accessories were $123.34.

From what I see, there is no damage to the radio. The box seems to have seen a little water - or at least high humidity.

So Sean, I hope you were talking about a different store and not the one in Garden Grove. I tried to find out if there were other clearance centers around the country, but the guy didn't know anything. So, if there is a clearance center, it is quite worth the effort to check them out often for their deals.

I recently moved from a city with no 800MHz action to one where all the police, fire, etc... are on 800. So I bought a new scanner. Now I'd like to convert the old one to 800MHz frequencies. I've seen boxes that attach between the scanner and the antenna which move everything from the 800 range to the 400 range. This would work, since the 400 MHz range is pretty well covered by my Pro-50.

Thus my question:

Has anyone had any experience with these boxes? Do they work well? What's a good price for one? I've seen them for about $40.00.

Thanks in advance

Rich,

I still stand by my statement on charging Nicads. I to used to race R/C cars(note: Yes they are the real ones that cost over $400.) and there was no, I repeat NO memory related problems! Overheating, and other misuse by me were the source of any problems that I had. Now that I am a Ham and deleing with radios everyday gives me a little insight on this subject and I am not a so called "expert". Read Cutis Wheeler's post, it is very well written.

P.S. Oh Yeah, I do work in the Construction field and use cordless power tools all the time and so does my father, uncle and cousin!!!

You donkey dicks make me laugh. You piss and moan about the government banning everything in sight and stealing your hard earned money with taxes, but when it comes time to vote what do you do? You stupid bastards either don't vote, or you vote for the same people who've been sticking it to you for years. Democrats and republicans are no different from the mob. They engage in strongarm robberies (read up on forfeiture laws),extortion (since you own a house and car you will pay us money "property tax" or we'll take them away from you and lock you up in a cage), and theft (can you say "kickback"). Any resistance is met with an armed response. Not to mention the fact that their lawmaking is for sale to any business industry (mandatory car insurance purchasing,anti-scanner laws for the cellphone industry,monopolies for cable tv companies and local phone companies, and I won't even get into the area of "intellectual properties"). You could get rid of all this by voting for a Libertarian next time, and give yourself a chance to live in a country that is truly the land of the free and home of the brave-not the home of cowards that gave up all their freedoms. But I bet you won't vote that way because you're just too stupid and you're afraid of freedom. That's why you deserve everything this "government" gives you. Get ready to submit fingerprints and turn in your scanners. It's going to happen real soon because you want it that way.

1048. OS456 not decoding DTMF properly

Newsgroup: rec.radio.scanner
Date: 1997-02-09 00:00:00 UTC
From: rr <not.my@real.addr>
Message-ID: <32FE9E5B.4C60@real.addr>
Source record: 208120
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I just recently purchased and installed the Optoelectronics OS456 interface board in my PRO-2006 scanner. It worked well from the get-go, but when I tested it's DTMF decoding capability, it kept giving the wrong digits!

I thought maybe it was a software problem, so I installed and tried other software (Radio Manager the first time, then the ScanStar Demo the second test). Same results... garbage output for DTMF decoding. I even tested the tones with an outboard decoding unit, just to verify the tones were being sent properly. They were.

Has anyone see this before? Opto's instructions are weak on any talk of decoding. Should I just call Opto and whine about it!?

All this talk about new laws, did the old ones work? NO! Will the new ones work? NO! the Lawmaking is secondary to what is really going on in Washington and in our daily lives. New Radio Monitering laws are a result of public opinion and Special intrest MONEY. More Money than public opinion. In the case of cellular phones 1. analog (clear)phones have been sold on the market for many years now almost everyone has one. So Many have been sold that the market for Cellular Phones has slowed down. 2. Wireless Companies need new products(phones) to keep the market and the profits on an upwards trend. The "Newt cell intercept" was a perfect way to boost the sales of NEW digital phones. By creating an artifical panic that every word you said over the air was being monitored by a third party. 3. Money. Large companies pay large sums of money to people and organizations that can help them out. It is these organizations that have the ears of our government. Not us the people of the USA! this is the real reason behind the hearings. 4. This takes us to our daily lives. Do we really need cell phones anyway??

Hello friends,
Most of yaall may know about this sight,but if not i'd like
to pass this on, and in hopes you can help me or maybe yourself. The
sight is (http://www.policescanner.com). you can hear live police calls
(not rebroadcasts) of the Dallas P.D. and Los Angeles P.D. on the
Realaudio plugin, witch you can download from there sight.You can put
Realaudio in the background and surf the net, and still hear the calls.
They allso ask you fore comments or what ploice dept. you would like on.
I asked fore the Pittsburgh PA. police dept. They said they would like
to, and what it takes is a sponsor, advertisers, or a partner. So if you
are any of these people or know of such people it may be in your or
there interest to contact Audio net. Dan Routman
(droutman@audionet.com). They are adding more police depts. I'm in no
way connected with audionet, i just wanted to pass this on, and maybe
help getting Pittsburgh connected, and maybe your large city.

Hey Glen,

Have you considered the guy is dyslexic? Word blindness is a VERY REAL
thing - I suffer from it and can understand. It makes spelling a major
problem because the eye/brain cannot recognise a the correct/incorrect
spelling.

Even with the best will in the world, It may be impossible to spell
teh same word the same way twice in succession.

Before you pick someone up on spelling have a little thought. To a
dyslixic sufferer that comment is as hurtful as calling a disabled
person "Gimpy"

Hi Bill,

I suggest the OptoElectronics http://www.optoelectronics.com OptoLinx It's very versatile. It works with the AR2700/8000, Icoms, and probably many others I haven't tried. It does support hardware signal (squelch) detection that many programs need, like mine, Radio Manager for Windows. There's more information available on interfaces at my Radio Manager for Windows web page at http://www.interplaza.com/bensware/rm.htm

Have Fun,
Ben

>See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring |
>Times, March 1997. |

Icom's choice of feature implementation shows, over and over again, that they still "don't get it".

For example, the default choice of a fixed delay after stopping on a busy channel (without regard to the presence or absence of continued activity on that frequency) is a throw-back to the days of the R-7000 which is more a receiver than a scanner. True, you can undo that, but you have no choice as to the delay after the modulated signal stops.

Still, a rare innovation appears. The ability to use the keypad, cellular-phone style, to enter alphanumerics (but without any helpful markings on the keypad!!) is a nice speedup compared to the drudgery of using the VFO knob to select characters.

Hello!

I've picked up a Regency MX7000 at a garage sale for peanuts.

The membrane keyboard has gone south, and of course, Regency doesn't make them any more. Before I go about constructing a new one, I thought I'd ask for advice in this endeavor.

Has anyone done this before? How did you do it? The matrix seems fairly straightforward; I'm more interested in the materials you used. I'd like to put something in place of the existing keyboard, not outboard.

Thanks in advance!

I just bought a 2037 from an RS outlet store. It has a serious problem
in that the weather broadcasts come in smack in the middle of the
railroad frequency spectrum. Cf. below for a post from Bob Parnassus.

In article <32FD4275.566A@null.net>,
Jerry Stack <jerry@null.net> wrote:

>I just picked up a RS PRO-2037 scanner from a RS outlet.

>on 161.190, a RR channel.
>
>Is this a quirk of this unit or should I take this sucker back
>to the outlet store?

I had the same problem with two PRO-2037s. From my review in
July 1995 Monitoring Times:

[....]

The PRO-2037 IF lineup is: 257.5 MHz, 21.4 MHz, and 455 kHz.
The use of up-conversion, a high frequency for the first IF,
should help reduce image reception because the image
frequency is moved much further away from the desired
signal. Sad to say that inadequate front end filtering
allowed images to be heard on our PRO-2037, but on different
frequencies than with scanners using a 10.7 or 10.8 MHz
first IF.

Strong signals in the 904 - 932 MHz range were heard when
the PRO-2037 was tuned 515 MHz lower -- twice the frequency
of the first IF. Automatic Vehicle Locating (AVL)
transmissions on 904.05 MHz were monitored on 389.05 MHz.
Several paging transmitters in the 931 MHz range wiped out
reception of federal government stations near 416 MHz on two
PRO-2037s.

Our PRO-2037 heard a strong 95.9 MHz FM commercial broadcast
transmitter on 138.7 MHz which is 42.8 MHz higher and twice

the 2nd IF. Railfans take note -- paging appeared on
frequencies in the 160 - 162 MHz range. On two PRO-2037s,
162.55 MHz NOAA weather transmissions were heard on 161.19
MHz......"

Reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

It has taken a while to gather all the information about Bob Adler, NZ2T. I will not pass judgement on what his peers in North Texas said about him. He has seen fit to attack me with profanity and insults. Further he has violated his word in saying he will not send me any more messages nor would he post further on the ham newsgroup. So I do believe what follows based on how Adler has treated me.

Adler is running for Section Manager in a vote to be tabulated February 18. There is at least one other running against him. I am told that Adler wears an unusual ï¿½costumeï¿½, as in untucked jeans trying to be a ï¿½cool Texanï¿½, that Adler likes to bulldoze people in North Texas, that Adler thinks that only he has the right answers, that he claims to have degrees in education that no one has seen, that he spent a large sum of money sending over 4000 pieces of mail to get reelected SM, that every Wednesday he gets on the 145.19 repeater and ï¿½preaches to the massesï¿½, that Adler is truly an ï¿½Iï¿½ man, he is wholly self involved, that Adler claims credit for the work of others, he demands to be liked and to be loyal, that he has a mole in the ARRL headquarters (Rick Palm?) and that he claimed he was going to shoot someone in Calif.

I have received these comments from North Texas both by Email and direct phone conversations. Adler has threatened me as well. Do I think he has the guts to do anything, no. But this could get him so mad he actually comes here and does shoot me. My family has been informed of this but I do not scare easily. If Adler was a real tough guy (like a U.S. Marine) I would be more concerned. But I think he is more like the Wizard of Oz.

Incredible universe had the ATT 9100 for $89 a few months ago. It was some
big sale. I , of coarse, came the day after the sale and had to pay $109.

After having had a table-top scanner for years, I recently purchased my first handheld (RS PRO-25). It is GREAT! It is much nicer to be able to take it anywhere. But do remember that a handheld is no replacement for a decent antenna. I hope to get a mobile antenna for my car and some sort of antenna for home.

Thank you, everyone for your helpful posts with your experiences with baby monitors. Armed with that information, I spent yesterday testing some of the more promising models. Here is my review:

I didn't test the Gerry or First Alert monitors.

The Playskool monitor is practically a toy. Weak signal, lots of static. Avoid it.

I tried one (which I've already forgetten the name of) at Target which had a portable, rechargeable, transmitter. The box said something like "For the First Two Years" on it. Anyway, it seemed kinda wimpy in comparison to the others, even though it claimed a "360 foot range" in the instruction material.

The Radio Shack monitor is pretty good. It's sensitive, small, and provides a strong signal. But the transmitter must be plugged into a wall outlet, (if you consider this an inconvenience.)

Fischer-Price makes several models. I tried the newer "Cordless Nursery Monitor" and the "Sound N Lights". They also make a "Super sensitive" which I did not test.

The "Cordless" model is small, quite sensitive, but the transmitter must be plugged into a wall. It might be a little TOO sensitive-- it transmits all kinds of feet-shuffling and object-rattling noises.

The "Lights" model is larger, almost as sensitive, and can run on 4 "C" batteries or be plugged into the wall. This is the one I settled on.

I also tried a hands-free two-way walkie talkie from Radio Shack. (The 21-408, a 49Mhz model.) I thought putting one unit on continuous transmit might be better than a baby monitor, but the signal wasn't on par with the REAL baby monitors.

Other useful info:

All other things being equal, a transmitter plugged into a wall will provide a stronger signal than one run from batteries. (When the transmitter give you a choice.)

A generic radio scanner will pick up the signal better than the B.M. handheld receiver which comes with the monitor. Maybe this sounds obvious, but it wasn't to me. It could be argued that the B.M. *receiver* would be

better, since it's specifically tuned to 49 Mhz and used for a specific purpose.... But apparently the quality of components in a radio scanner wins out! If your neighbor has a scanner, don't talk trash about him when the monitor is on! ;-)

Finally, I reccommend buying stuff from Target. They have clean, well-stocked stores, good prices, and don't complain when you return merchandise. I've bought a lot of things there, and they've always given me good service.

Just finished viewing the taped delayed House hearings on cellular telephone privacy. Rather interesting. Much of the knowledge covered has been around for a few years. But think about this: remember the Clipper chip controversery a few years back? Just think wouldn't this be a great time to re-awaken the idea of a clipper chip and really protect the public's privacy on cellular telephones? Interesting isn't it how things just have a way of coming around to ideas introduced by the government???

> and which kind should I avoid. Please post your suggestion.
>
> Thanks in advance.

"best" is kind of subjective isn't it? One man's garbage is another man's treasure. Ask ten people and you'll get ten different answers.

Some base models do offer more features and better receiver quality but a lot of handhelds these days are no slouches! Before anyone can recommend something, I think we have to know what price range we're taking about. Base models can run from $200 to $2000. Handhelds start a little lower and top out around $600.

Would you be happy with a scanner just at home or would you like to be able to take it with you where you go? Could you run afoul of the law by carrying a scanner in your car where you live?

Popular handhelds these days include :
Uniden BC230XLT $200
Pro-51 $200-$300
RELM HS200 $250
Pro-60 $250-$380
Uniden BC3000XLT $350
Yupiteru MVT-7100 $450
AOR AR8000 $550

Popular base units include :
BC860XLT $150
Pro-2037 $200-$300
Pro-2006 $300
BC9000XLT $350
Pro-2042 $370
AOR AR3000 $1000
AOR AR5000 $1800
Icom IC-R8500 $1900

The above prices are just basic guidelines..they'll give you something to start with.

Transmating? Is that like haveing sex while in a moving vehicle or
something? Well anyway, a lot of electronics equipment gives off ambient
radiation that can confuse other electronic devices, particularly radio
transmitters and receivers. Try tuning a scanner near your computer and
odds are that you'll hear some sort of tone that changes when you access
your hard drive. This is sometimes called a "birdie," and it can interfere
with radio equipment. Many types of electronics emit a birdie which can
louse up other types of electronics at close range.

Sounds like a mixing of a cordless phone and their frequency of 154.6
(give or take). Cordless frequency of 49.5 and 154.6 will give a product
of 105.1, although the modulation should be low. About 1/3rd.

It depends on what you're listening to. I know of may freelance photographers and reporterd that respond to police and fire calls. Their ability to provide pictures at an accident scene can become profitable to them. BTW, they have been asked by police officers to take pictures AS LONG AS they don't get in the way, touch any evidence, or speed to the scene, or stay clear of any suspected crime scene.

If I was to buy the aor 8000 what else would I have to buy to make it a complete system for computer scanning? what are some prices? at a total cost is it still worth it? would this handheld pick up better then the average $400 base scanner? and I still do not understand why to buy this scanner over seas just for cell coverage when the us model can do it? Please help me out even if just some answers THANKS!

1096. Looking for a Plectron/Instalert Ttech.

Newsgroup: rec.radio.scanner
Date: 1997-02-09 00:00:00 UTC
From: sovens@efn.org
Message-ID: <5dm0ih$8cq@garcia.efn.org>
Source record: 208210
Cross-posted to: sci.electronics.misc,sci.electronics.repair,rec.radio.scanner

Hello. I am looking for somebody who has some experience working with plectrons, or more specificaly, an Instalert EC-22 receiver. I have removed the tone decoder circuit board, and I want to use it in another project, basically, putting the tone decoder circuitry on another radio. This would be easy, as soon as I know a few things.
I took this board out of the receiver about a year ago, and I forgot to mark which wires were for what that connected to the board. I was wondering if anybody could help me with them:

AF (Audio Frequency in??)
X
Y
R
T
10 (I think this was the 10volts DC in??)
ON/Y (connected to Y)
TP1-TP4

And, ground I think is provided through the mounting lug thingies...

Also, does anybody know about tuning the tone filters, like, can I change their frequency 100 Hz or so by using the variable resistors? Which ones??

Thanks a lot for anyvody that can help...

Hi,

I have a Radio Shack PRO-60 that I want to modify to extend coverage.
A friend of mine has one that has more coverage than mine. When I looked
inside both of them, they look different.
Mine is Pro-60 CAT 20-309.

Anyone knows where I can get info on this ???

please reply at jph@eblw.com

thanks.

I have a PRO-51 scanner from Radio Shack. Like it just fine. Question relates to the DC power cord.

Does anyone know if the cigarette lighter cord for this unit includes any voltage dropping resistance or does it deliver the full car battery voltage to the rig's DC input? I have an old DC cord from another rig - but don't want to fry the PRO-51 if it's expecting less than 12-13 volts at the input. Thanks.

On Fri, 7 Feb 1997 17:09:43 GMT,
in the newsgroup rec.radio.scanner,
tweek@netcom.com-NO.SPAM- (Reverend Tweek)
from Our Lady of Perpetual Freedom thoughtfully posted:

> MORE TECHIE: A secondary tuner, working at the IF frequency of
> the TV set, will allow you finer control and rejection of various
> signals within the passband of the TV set.

Yeah. And don't tell them that a scanner tuned to around 41MHz,
placed next to said TV, could "accidently" pick up the IF signals
containing these "illegal" transmissions.

...and this would be bad thing! Even though you did not *intend*
it to happen.....and the "radiocops" will break down your door
and confiscate your scanner & "down converter" (er, um, 15 year
old TV) and throw you in jail with all those other "menace to
society's"..

So, to prevent yourself from being placed on the FBI's "most
wanted list", do not operate a pre-1985 TV set, tuned to channel
81-83, while simultaneously operating a scanner (tuned to 41MHz)
in close proximity to the TV.

I know how common this situation is, and I don't want to see any
fellow "hobbyists" get in trouble because of it.

I just bought one the other day. Scanning function, 300 mW output, NO CTCSS tones though. Receive sound quality is pretty good... Don't know about transmit range. Made it a mile to my scanner, but was a pretty noisy signal... still scanners aren't as sensitive as the radios they listen to.

How do you know that? Interesting -- I still have time to take mine back and get another. I'm picky.

By the way, I tried a NorthwesternBell Excursion 39200 and it's rock bottom! Half the range of my AT&T 9100, can't change channels, poor sound quality (both ways). Way too cheap.

Nothing that I know about, provided it's already connected
with a low loss transmission line.

By design, the discone provides uniform, but lackluster
performance over a wide range of frequencies.

Use or build a resonant antenna which is optimized (tuned)
for about 167 MHz. Commercial base station gain antennas are
available from Hustler, Cushcraft, and others. You could modify
a 2 meter ham antenna cheaply. It would require retuning
for best performance because 167 MHz is far enough away from
the design frequency of 146 MHz.

I'm not sure that I understand the question, but the AOR8000 can be reprogrammed. If you bought the model here, reprogramming will not make it the same as the AOR8000 sold overseas because the bandplan would be the US version regardless of the ability to tune cell phones. Euro versions can be reprogrammed with the US bandplan as well.

I have had the Pro-51 since Christmas. It is the only scanner I have
experience with ... but it works great for me. It was a little hard to
figure out, but now it's a breeze. It even passed the 5 foot drop test
with flying colors.

Last I knew, it was released in Europe but is still pending
FCC certification for import to the US. If you pay the extra
price(and get the cellular coverage) you can buy one from
an importer. Otherwise, you'll probably have to wait about
1-2 months for it here in the US.

In addition to the others already mentioned, let me add
the discontinued Icom W2A which may be had for about $300
on the average at ham fairs, or rec.radio.swap. It sports
two separate displays for each band (VHF vs UHF).

Let's see, the biggest differences :
1) The 150 uses a ni-cad, the 51 uses 4 AA batteries
2) The 150 only has a band search while the 51 has
a programmable search
3) The 150 is selling for about $160 these days while
the 51 is a joke at $300...is currently on sale for
$200...has been as low as $180.
4) The 150 has better audio power and sound quality
5) The 150 has a power-on resume feature(it resumes
what it was doing when you switched it off; the
51 simply reverts to scanning like most radios).
6) The 51 has a long squelch tail. If you are new to
scanning, it should not bother you as much as it
does those of us who are use to other radios.
7) The 150 has 100 search lockout frequencies.
8) The 51 comes pre-programmed with some Air, Fire,
Marine and Weather frequencies. The 150 is only
pre-programmed for weather.
9) The 150 has ten prioirty channels compared to the
one on the 51.

Reviewing the 51, I think you'll find it has more in
common with the BC220 and BC230.

Try going to http://www.dejanews.com/ and searching on
"Sportcat", "SC150" and "Pro-51".

One major problem with this all Jake. The law enforcement folks are against any form of encryption on any form of communications. They figure that it will make their job of catching the crooks too hard as they will not be able to eavesdrop on the conversations in the event that cell phones, cordless phones and the public radio service go encrypted. Talk about a catch 22 situation. The biggest group of "illegal wire tappers and listeners" is the law enforcement crew themselves. They have the national security group convinced that crime will run rampent should cell phones be encrypted. The way it is now they don't need a court ordered wire tap to listen to the local pimps set up their girls for work or the local crack salespersons make sales via the cell phones. That is what the casual listener has to face in the future. Big brother has no use for those that wish to listen to him in action or to stiffle his access to the private sector via easy listening radios. He just wants the private sector to think that the phone conversations are private and

secure no matter what form of communcations is used. That way foolish folks say foolish things in the clear for big ears to hear.

Fred

I may not always agree with what you say. But I will defend to the death your right to say it.

From the FAQ:
BUYING A USED SCANNER RADIO

Copyright 1997 by Bob Parnass, AJ9S

[...]

R-10: late 1996 vintage (serial number 01048 tested). Shirt |
pocket size multimode is powered by 4 AA penlight cells. |
Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, |
LSB, AM, and CW detectors included. IF bandwidths are |
fixed. No 30 kHz bandwidth for satellite or FM military |
monitoring. Battery saver circuit, with selectable duty |
cycle. Single VFO and 1000 memory channels. There are 900 |
memory channels divided into 18 banks of 50 channels each. |
Another bank of 100 channels used to hold unique frequencies |
found during an auto store operation. 20 pairs of search |
limits. Up to 100 frequencies may be locked out during a |
search and stored in a final bank of 100 channels. Each |
channel can be programmed with the detector mode (e.g., AM, |
USB), a tuning step size, an attenuator enable flag, and an |
8 character label. CI-V computer interface requires extra |
cost hardware. 7 segment S-meter. Noise blanker. Good |
sensitivity. Lighted keypad and display, but keystroke |
sequences are cumbersome. |

Good radio hardware in a handy sized package, but scanning |
performance unimpressive. Very slow memory scanning at only |
6 channels/second. Searches at about 16 steps/second, with |
little or no worthwhile improvement using the "Signal |
Navigator" feature in the R10 I tested. Rescan delay cannot |
be disabled. Can only scan one memory bank or all banks, |
not a combination of banks. No squelch for SSB or CW modes. |
See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring |
Times, March 1997. |

If you question RS as to why they need your name and address, stating that
you don't want any junk mail, they will promise you that the information
is ONLY used for internal mailing lists so they can send their catalog.
Seems to me then that someone could get a pretty decent legal settlement
if RS were to release their name and address to any outside agency.

This probably has more to do with RS wanting to make sure they don't get sued for "gender bias" than anything else. Males are requried to wear dress shirts, pants, and ties. I suppose anything goes for the gals, lest they sue and wind up with $81.5 million (the amount of the recent Publix "gender bias" settlement.)

If you think the airwaves are public just go out and try to use a walkie-talkie on your local police department's frequencies - or tune a few 800 mHz radios to transmit and receive on cellular frequencies and then use them to talk to your hunting buddies. The FCC has recently auctioned off huge chunks of the radio spectrum to various corporations, giving them exclusive use of those frequencies. Monitoring these airwaves has only remained a "right" because it's so damned hard to locate someone who is. Remember, in England the only thing it's legal to listen to on a scanner is amateur radio, marine and aircraft. Even police and fire are illegal to monitor.

Dictatorship? You're much too paranoid.

And you believe our government would force a court order upon Tandy to release their scanner customer database?

Or do you believe Tandy would commit corporate suicide and simply release this information on their own?

You ASSume a lot...like the original buyers still have possession of their units, and never sell or trade to anyone else.

Japan also plays games with it's statistics.

Family murder-suicides are all listed as suicide.

So if a father kills his three children, his wife, and then himself its
counted as 5 suicides.

Let's not compare apples with oranges. Handgun Control may lie, but
that doesn't mean we have to accept their BS.

I don't know how far we'll get with the "right to monitor" argument, but there may be a better one. The CTIA reps keep mentioning the "right to privacy" that they allege cellphone users to have. Yes, the Supreme Court has identified an implication of such a right hidden in the Fourth Amendment.

BUT... The rights that the Supreme Court is trying to protect are those rights a citizen has to protect him/her against the actions of the GOVERNMENT (mostly the police) when they are engaged in a criminal investigation. Search & Seizure rights, just like your right to counsel and your right not to pay excessive fines, do not apply to everyday relations and actions between and among private citizens.

Our so-called "Constitutional right to privacy" only protects us from the police, not from our neighbors. We must take lawful steps to protect ourselves from them, whether it be to use scrambled radio devices or to lock our doors at night. The argument that a private citizen with a scanner can violate some cellular user's "right to privacy" is not supported by case law.

Of course, if it were legal for private citizens to casually monitor these conversations with just the Section 705 restrictions, then they would have all those potential ears to help them find more crooks.

>cell phones be encrypted. The way it is now they don't need a court >ordered wire tap to listen to the local pimps set up their girls for work >or the local crack salespersons make sales via the cell phones. That is

This is not accurate. Under ECPA, they do indeed need a warrant to monitor cellular and any other type of mobile phones.

Recently visited the http://www.fcc.gov And took a quick glance at
the article on "Family Radio Service". As quoted from a article that
was posted.

>It is for your family, friends and associates to communicate among yourselves within your
>neighborhood and while on group outings. You cannot make a telephone call with a
>FRS unit. Expect a communication range of less than one mile.

You say the radio has 300mw output. Walkie-talkies had about the same kind of output and about the same range. So you might have a mile to two mile range at maximum. If they "FCC" says to "expect a range of a less than a mile". I guess you could say that the radio is not going to much more power than what you stated, and that it might be the legal limit. And you said there were already a couple of idiots act stupid.
I also read a article under "GMRS", looks like the channels that listed there are also shared with "FRS". Sounds the idiots could be operating on FRS or GMRS. Enjoy!

It's quite different.

ICUs (and hospitals) are relatively "clean" areas, and operate as such.
They are environments in which RF can be more or less controlled, by
making everyone put their gear in receive-only mode or turn it off.
They're also a lot bigger, and tend to be made out of sturdier material.
Life support equipment is much more delicate than, say, a 747, and has
much lower RF interference tolerances. Internal pacemakers and
defibrillators usually receive their programming instructions through
low-power radio signals. Stray RF, from cell phones or two-way radios,
can sometimes cause them to misbehave, though I personally have never seen
that happen.

The original poster's point was that if a cell phone on board the aircraft
was responsable for disengaging an autopilot, then why are you still
allowed to use cellular telephones in an airport? Why are there cell sites
allowed near airports? If airplanes are as sensitive to RF interference as
internal defibrillators, why aren't there more incidents like this? I can
see a cell phone mucking up an ADF or Tacan signal, but disnegaging an
autopilot? Come on.

This phenomenon is not a myth at all, but a well - known characteristic of nicad batteries. If you don`t bnelieve it, then CALL the people you are quoting as experts (the manufacturers) and they will TELL you so. Nicads grow "whiskers" between cells, causing them to exhibit a "memory" effect. Go ahead. Call them up. Any ham radio operator is familiar with this effect, and literally TONS of articles have been published in ham radio articles over the years.

> Okay folks, this nonsense has gone on and on with nobody offering

You just missed Bob Parnass' update to his marvelous article, BUYING A USED SCANNER. I feel so guilty posting only a portion of this text, that I offer a copy free to anyone who sends a piece of EMail to: ftp@atdbbs.com and request a copy of "Buying a Used Scanner." You'll receive the entire, current article via return EMail. SO...with apologies to Bob, here's the portion of this informative text that relates to crystals:

BUYING A USED SCANNER RADIO by Bob Parnass, AJ9S
Part 4: Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

American Crystal Co.

See what I mean? This guy knows more than the Engineer who INVENTED
Ni-Cads who has repeatedly said memory effect is bullshit.

What part of "NO" don't you understand? N or O?

I don't know how else to say it, the inventor says it's a myth!
NASA says it's a myth! Motorola says it's a myth! But Joe Ham
Radio Operator says he's smarter, and he read it in 73 magazine.

Go figure.

Hospitals tend to ban this sort of thing for the same reason major
airlines do it: liablility. If something goes wrong, for whatever
reason, and there's a radio device being used, you can just about bet
that there'll be a major lawsuit involved, even if the phone, radio,
scanner, or computer didn't have anything to do with it. So rather
than take chances, they just ban anything that has anything to do with
electronics. I've used a 5-watt ham radio in hospitals, and nobody
died as a result. A cellphone uses less power, and is probably a lot
safer than a ham rig.

>The original poster's point was that if a cell phone on board the aircraft

>see a cell phone mucking up an ADF or Tacan signal, but disnegaging an
>autopilot? Come on.

Exactly. Airline equipment is no doubt extremely well shielded, as is
hospital equipment, for the reason that stray RF cannot be completely
controlled. Good RF shielding design is pretty much mandatory for
equipment where lives are at stake. 999,999 times out of 100,000,
there probably would be NO effect by using a scanner or cellphone in
an airliner. It's that one time they worry about. Turning off the

stuff during critical times such as landing and takeoff only makes
good sense.

Don't know, I have a pro-62 and a BC760XLT. The pro-62 filters better.

>And a sincere newbie question, Steve: Why does living near police/fire
>call for triple conversion?

I finally got over to Radio Shack and it indeed is the 2037. Thanks
for all the comments.

As far as triple conversion and living near the police/fire. Well, I
get these overwhelming signals which can show up on other
frequencies (read *not* the intended frequency). I have noticed
my pro-62 scanner filters them out much better than any of my
other scanners. I attribute this to the triple conversion front end
which tends to keep the signals where they belong.

As an example. the local fire freq is 33.54, and the police freq is
39.200. On my"lesser" scanners, When a fire tone goes out,(on 33.54)
it comes accross 39.200 as this terrible noise. On the pro-62 it stays
on 33.54 and scans right by the 39.2 channel. The fire dept is putting
out 100 watts about 1/4 mile away.

Oddly, the selectivity specifications do not appear in
the Uniden BC9000XLT Service Manual.

This information might help. Here are the filters used
in the BC9000XLT:

58.075 MHz 2nd IF:
FL3 = Crystal filter FL581 UMF5014A

455 kHz 3rd IF (AM and narrow FM):
FL5 = Ceramic filter FL679 KBF-455R-20A

5.5 MHz 3rd IF (wide FM):
FL4 = FL582 SFSL5.5MDB

>
>Is this a quirk of this unit or should I take this sucker back
>to the outlet store?

I had the same problem with two PRO-2037s. From my review in
July 1995 Monitoring Times:

[....]

The PRO-2037 IF lineup is: 257.5 MHz, 21.4 MHz, and 455 kHz.
The use of up-conversion, a high frequency for the first IF,
should help reduce image reception because the image
frequency is moved much further away from the desired
signal. Sad to say that inadequate front end filtering
allowed images to be heard on our PRO-2037, but on different
frequencies than with scanners using a 10.7 or 10.8 MHz
first IF.

Strong signals in the 904 - 932 MHz range were heard when
the PRO-2037 was tuned 515 MHz lower -- twice the frequency
of the first IF. Automatic Vehicle Locating (AVL)
transmissions on 904.05 MHz were monitored on 389.05 MHz.
Several paging transmitters in the 931 MHz range wiped out
reception of federal government stations near 416 MHz on two
PRO-2037s.

Our PRO-2037 heard a strong 95.9 MHz FM commercial broadcast
transmitter on 138.7 MHz which is 42.8 MHz higher and twice
the 2nd IF. Railfans take note -- paging appeared on
frequencies in the 160 - 162 MHz range. On two PRO-2037s,
162.55 MHz NOAA weather transmissions were heard on 161.19
MHz......"

Reprints of articles from Monitoring Times are available

I definitely agree on the poor sound quality. I bought a AT&T 9300 from Price Club - Costco for $150. Digital, 100 channels, spread spectrum, longlife battery were all advantages. However, I had to return it because the mike feedback into the earpiece made it sound like the long distance phone calls of old and the general sound from the earpiece seemed vastly attenuated in frequencies.

When it comes to federal regulations, I sometimes feel like a parent lecturing a spoiled child. 'Now Junior, I gave you a new toy last week, but you left it out in the rain. And, now you're demanding the new, improved version of this toy? I'll consider buying you something else _only_ when you can show me that you can properly take care of the toys that you have.'

Oh but if "you've got questions, we've got answers".

Well slightly off-topic but a Rat Shack thread is always fun!

This sounds like a recent experience I had at a Rat Shack. I went
into the store and after about 5 minutes this girl came out of the
back and greeted me. She was wearing shorts, a t-shirt, and was
barefoot. As you could imagine, she did not not know *squat* about
anything either.

Well, I've not heard anything about a campaign to get rid of cellular telephones in Canada. That would be akin to stopping a freight train with your fist, I reckon. The latest and greatest (so their marketing folks would have you believe) is "Clearnet". It's a consortium of communications big-wigs (Motorola et al) that has a digital 800MHz (soon to be higher?!) network. They're aiming it at companies that have two or more means of communications already. (pagers, cells, two-ways). They're not giving the service away like the Cell companies. FWIW, I was told that Ontario/Toronto has the cheapest Cellular service in the world. I pay 50$CDN a month for mine and that gives me 30minutes during the day free and flat rate between 6pm and 8am and all weekend too. I wonder how that compares with other places?

> Meanwhile, we see our personal freedoms being eroded one at a time by
> mis-guided lamebrain politicians here in the US. (Not that the Dominion
> doesn't have 'em too like everyone else).

This is too true. Big business seems to dictate what is legal and not here too. An anectdote....I used to work in the info-services department of an oil company. At one point the difference in pump prices between Quebec and Alberta was so profound that tanker-trucks were buying regular no-lead (road tax and all!) at the pumps in Alberta, driving to Quebec and selling to gas stations (typically independants). A couple of very sleepy drivers put over 1,000,000$CDN in their pockets in one year! The oil company's answer to this? Have the government pass a law making it illegal to transport gasolines across provincial borders!!

> Canada, U.K., Netherlands, and other countries have more personal freedoms
> than the United States, the once proud champion of personal freedoms. Sad,
> eh?

I think their are too many lawyers in politics! We need more politicians from Main Street - not Wall Street!

Cheers!

It depends on which border it is traversing.

For what it's worth.....I live in Canada and I've discovered two things about ordering things from the US. It arrives just as quickly if sent ground mail instead of UPS. UPS ALWAYS holds things up at the border and charges you outrageous "clearance" fees. They NEVER seem to put it through in the right category. ie: Amateur radios and computers are DUTY FREE as are antique car parts - most of the things that I order.

Tell 'em to toss it in the mail - ground. It's cheaper!!

There are about three of them. Two of them you will find on the net, if those two dont work, you will have to use the third one discribed in Bill Cheek's Ultimate Scanner Book. Go to www.altavista.com and type in "200xlt" in the search blank. You should find it after a couple clicks of the mouse. Sometimes the resistor will be a carbon or a surface mount. You might as well do the low battery and speed-up mod while you are at it.

Aeronautical Beacons (in the US) use call signs that do not comply with
the international standards. Check a sectional chart at your local
airport for the calls of beacons near you. If you have a directional
(loop) antenna, you can take a bearing on the beacon(s).

VLF (500 KHz and down) is used for radio location (beacons and LORAN),
time (60 KHz, WWVB) and communications (radio teletype).

->Jeff Multer, Charlotte, NC
->
->
Jeff,
I'm the origional poster of this.
The conversations heard are always in Spanish (which I don't speak) and are very informal sounding, like families. I don't suspect any military or govt. user.
This is also not an image. I first discovered it *as* an image when I heard this on my BC760 over USSS Charlie freq. Knowing the IF of the radio, I did the math and came up with 143.675. I also checked this with other scanners (2006/Pro-43/Pro34) with different IF's and triple conversion etc., and it was really there.
Replys I've received mention So. American cordless phones or illegaly using two meter radios off the band. I strongly suspect the latter scenario and I heard from a southern CA listener who claims to hear this type of thing coming from Tijauana, on, or around this freq. often.
Any other ideas?
Phil->

Obviously you got this from a cellular or cordless phone, this is the kind of activity that gets us all into trouble, especially in light of the recent congressional activity. Get with it, hacking has it's uses, but don't misuse it.

Hi, Doug:

A few years ago I replaced my membrane keyboard from my Regency Mx-5000 with a new one purchased from Ace Communications in Indianapolis, IN. I think I have read that they no longer support radios made by AOR (The Regency Mx-5000 and Mx-7000 were both maunfactured by AOR for Regency), but you might check with them anyway. I don't have their number handy, but you should be able to get it through directory assistance.

Another great source of parts for old scanners is G&G Communications in LeRoy, NY. This is a home-based business, but Gerry, (the owner) has a very extensive supply of parts. Their phone number is 716-768-8151

Hope that helps.

I have a Yeasu FRG-100 in mint condition. Less than 10
hours operation. Included is a Radio Shack DSP and a
Personal Code Explorer hardware/software device for
decoding WEFAX, RTTY, AMTOR, SITOR and Morse Code.

I want to trade this for an (IBM) Laptop 486 color
computer of equal value.

Bose, Telex, and Clark make these type headsets for aeronautical use
(I've been thinking of getting one but they are very expensive...prices
are slowly starting to come down due to competition...Bose original
headset was over $1000...and that's NOT MSRP, but retail!).

Recently seen a Sony headset with ANR(Active Noise Reduction) that
uses either one or two AAA battery to provide power to the unit.
Have not heard any reviews of it yet though.

>the law???

Press is exempt. That was brought out.

But the press can only buy so many scanners...so where do the rest
of all those thousands into the hundreds go: who buys them legally?

then it was suggested that this would be made ILLEGAL: buying any
scanner which can zero in in Cellular Radio talk. someone then
brought out the fact that you can already listen to cellular talk
by utilizing the 480 range he proceeded to explain how to and why.

Now...that means that the next step will be for legislators to
see who else don't want to be listened to and strike out to protect
them from the ears of America.

is this a fascist idea or what?

Cheap scanners
Looking for cheap, older model scanner (not rock bound)...it needs
only to cover public service bands. I am interested in police, fire,
and emergency transmissions....but the wife wants to eavesdrop on cell
and cordless...therefore my 200XLT has been lost for my purposes.
I am interested in 16 or upward channel models at a cost of less than
$50...don't tell me that I am just wishing because I have seen many
posted earlier...yet at that time the wifes eavesdropping was not as intent
as is it now and I foolishly ignored those cheaper scanners...I do
hope that one of my fellow enthusiasts has one of these mearly useless
models laying around and will be willing to part with it cheaply.

They have been in businesss for a millenium...bought all my
bearcats from them...early day of bearcat 300 and even before.

Never have I had a single problem with them...they ship right away
and within a week or ten days you got yours.

But you might want to check out Grove Electronics and if they have
that model you will save even more...bought quite a bit of stuff
from Bob because he's easier to talk with on phone when you need
precise info about a scanner you want or an antennae you are going
to buy, but not sure...he really helps.

You save about twenty dollars more or less with Grove...plus they
have a catalog which you can get byh asking for it...they have
an 800 number and have a WWW site....they put all their scanners
for sale on it...so you can see descriptions of what the units
do...or don't do.

Either one... but then too there is ACE Communications...they
have bargains to get...only bought from them once...prices a bit
higher than the other two...

ask 800 info for Grove Electronics....

or ACE....

get their catalogues....

I was given a scanner from a friend, he used it while driving a truck, but several states have really cracked down and he choose to leave it at home. It is a BCT-2, and is a nice mobile unit. I know that a lot of thing are pre-programed into it, and right now the only things that I really pick up are the local police...makes for interesting listening :)

I don't see any freq listed in the unit for the BCT-2 and was wondering about the range of it abilites.....which freguencies does it pick up???

Any input would be appreciated...

Hi,

On Sun, 9 Feb 1997, rgdong wrote:

: > >I'm looking for a HAM radio VHF/UHF transceiver also capable of
: > >scanning and receiving TWO frequencies AT THE SAME TIME. I would like
: > >to use this feature to monitor both the repeater input AND output
: > >frequency AT THE SAME TIME.
:

Have the newer Ham rigs fixed the overload problem, such as the ICOM 2410 has, when listening to two frequenies within the same band?

At that time, I called ICOM, but the fellow I spoke to didn't even know there was a problem. Then I received a letter from ICOM thanking me for bring the problem to there attention and they would be working on a solution.

And does anyone know if ICOM ever mentioned a patch for the problem in the 2410, besides turning on the ATT function?

Thanks

Michael (shotgun@best.com)

Well you have two options here. 1 is to buy a tape recorder like the
Panasonic Microcassette recorder model RN-404. It features voice
activated recording. Simply get a patch cord from Radio Shack and plug
it into the earphone jack on your scanner and into the microphone jack
on the recorder. It can be set to record only during conversations.
2nd and depending on your computer set-up is to download ReCall which is
a shareware program available for free at
http://www.sagebrush.com/~sells/
If you have a sound blaster card or compatible in your PC you use the
patch cord between scanner and mic input on sound card. (do not use line
in jack.) This is a voice activated recording program that will save
the conversations to a wave file for you tto play back. It has a great
compression scheme so recording an hour conversation can take up as
little as 4 megs on your hard drive. I have tried using both and use
Recall only now.

That's usually because the laws banning fireworks are state, and not federal, laws. With the cellular ban being federal, it may very well apply on reservations.

Even if it were legal to sell cellular-enabled scanners on a reservation, you'd have to get them there first, and this would almost certainly involve transport through state/federal land or water. Hey - maybe they could be assembled on the reservation!

Indian casinos in the Northwest US have had many problems getting gambling equipment (i.e. slot machines, video poker, etc.) without the equipment getting confiscated by or state agents along the way.

I bought a BC 3000XLT from them in December and was very pleased with their service. At Christmas, they extend their 10 day return time if the purchase is to be a gift. When asked if this was to be a gift, I said yes, to myself, and they gave me the extension.

Also, Scannerworld cautions that this radio won't receive FM commercial radio broadcasts or TV sound in spite of the fact it would appear to get the FM band and the VHF TV stations. I was surprised they said this, I can receive these broadcasts. I can only imagine they were acting to ward off potential disappointment.

In summary, I found them to be very easy to deal with.

Hi,

I'm planning a trip to Disneyland in a few weeks and I was wondering if anyone knew of some interesting frequencies for the park. I've found

http://www.zianet.com/kc5kto/generalfrqs/amusement/disneyld92.frq

already but the most recent information there was almost 2 years old. Has anything changed in the park? Are they using a trunked system or anything?

Finally, does the park have a policy about [discreetly] listening on a scanner?

Thanks!
-Pat Dirks.

1254. New Cell Phone Channels?

Newsgroup: rec.radio.scanner

I bought a new cell phone and in the instructions, it states the phone is a 832/2412 channel model. I know all about the 832 channel layout, but what about the 2412 channels? Is this some kind of multiplexing on existing channels, a change in the 30 kHz spacing between channels, or a new frequency band in use? And is there any areas using these new channels? AND CAN I HEAR THEM LIKE THE OLD CHANNELS??!?

Hi!
I had the same problem with my 535. Even sent it back to get looked
at. They said they got it to work fine with every software package. I can
only get it (DTMF) to work reliably with the Probe software. I get no
output when I should get it, and spurious when I shouldn't get it using any
other package. OE can't explain it, nor can Perry (Probe author). So, for
that and other reasons, I use Probe!

Good luck!

I have found Communications Electronics (CE) in Ann Arbor to have about the best prices around, they advertise in all the Radio Magazines.

I also have had very good experiences with a company out of NYC called "Metrosoft", they are on Lexington Ave and have a WEB site but i don't know the URL off hand.

Hello Everyone:

What can anyone tell me about the double discone I am now seeing in a couple of the radio catalogs?
Thanks for the help.

73,
Ryan

That Radio Shack slogan has got to go. I went into a RS by & asked about the mabile 2meter ham radio they had. I asked the salesman if it could pick up MARS . The gave this odd ball look like I meant the darn planet & said he didn't know. I think they have got to fire the stuff & hire people with knowledge of this stuff. In fact I had a guy try & tell me that some new scanner they had could be modified to get the cell phone & meanwhile it was made after the law took effect against cellular modifiable scanners.

I say forget the batteries, especially if you're going to be
outside. Buy a rechargable. I have a "the first years" one,
and it even works at my neighbors house. (I don't hang out
there, just need to go for a second sometimes.)

I purchased the SportCAt about a year ago and returned it mainly because it did operate very long on the nicad pack and you could not use regular alkaline batteries in it. It seemed to perform well, however.

I don't know much about the PRO 51, other than that it has been described as a decent double conversion receiver. One thing you might check out is whether these units do a "limit search." This means that you can enter the lower and upper limits of the frequency spectrum you want to search. Some units have "band search" which means that they will search in a preset band. I have found that this is not terribly helpful since the limits are so broad. I believe that the PRO 51 will do this. I can't remember if the SportCat will.

I have a PRO 46, and the rubber duck on it seems as good as the extendible that I bought there. It is helical around a flexible tube with a plastic cap on the end.

I do have an old bag cellphone antenna and wondered if there is a BNC to cell-type connector so I can try it on the scanner.

I would like some input from someone who has tried a new type of headphone which is designed for noisy environments. I seem to remember seeing this on Discovery 2000 or some such TV program. Here is the text from a web site I visited recently.

This is one product where the term revolutionary truly applies! Listen to audio through the headphones while the background noise around you is electronically cancelled out. You get truly fantastic sound without any annoyance. We've tried them while standing next to a blaring stereo; we put on the noisebuster headset then let the enhancer circuitry sample the noise, and totally cancel it! The effect is amazing! It's as if we were suddenly standing in a quiet room! Then we were really sold...we plugged in a portable audio device and the sound was amazing! The noise cancelling results in distinct and clear audio. You hear what you want to hear, without any noise interference from around you. Plus, you don't overamplify your portable radio, CD, or cassette, causing it to distort and rapidly drain the batteries.

technical specifications
frequency range 20-20,000Hz
active cancellation >15db
cancellation range 7db
headphone weight 90 grams
cable length 32 inches
power2 AAA cells
battery life 100 hours

Here's how it works: Microphones in the headphone listen to the noise that's coming at your ear and messing with your sound. Information from those microphones is fed to the audio enhancer pack (that's the little gray box above) where it's analyzed and a precision active noise cancellation wave form is generated. When this "anti-noise" wave meets the unwanted noise, the outside sound is effectively cancelled out, and the sound you're putting into the enhancer pack comes through loud and clear!

You may have seen noise reducing headphones in use at aiports, race tracks and construction sites. These devices try to make an accoustic cell around your ears to reduce the

outside sounds. Problem is, they also act something like a vice pressing around your head. Not comfortable! What's more, the good ones costs hundreds of dollars. Noisebuster achieves exactly the same result, but it's far more economical and so comfortable you can wear it for hours yet hardly notice it.

The Noisebuster extreme truly is a revolutionary product. Within two weeks of its introduction in January of '97 it had already been featured in USA Today and CNBC television. We highly recommend it for listening to any kind of portable sound unit, be it a radio, cassette player, CD unit; whether you're on an airplane, at a sporting event, or just out cutting the grass with a noisey lawn mower. What's more, you can also use it without an external sound source any time you simply want a little peace and quiet!

Hype or a really neat new product?
Have you tried it?

email
winndixie@bellsouth.net
or post here
thanks...

Victor,

We use these devices at HP, in the plant where we make Inkjet cartridges. I'm an automated equipment technician and often work on machines with the doors open. The noise busters help a lot. The nice thing is they allow the voice frequency band to pass pretty well. The down side is the cord hangs up on things as I work, so I run it under my workshirt. The kit also includes adapters for use with airline sound systems, the noisebuster blocks out the engine noise probably 80%

Lorin Winchester who is at mailto:playhaus@news.gate.net
says...
> I'll be picking up my fiancee at the airport next weekend, and I'd like
> to take a handheld scanner with me. I was wondering if airport
> personnel frowns upon scanner usage. Will I have any trouble getting
> through the metal detector while carrying my scanner? I mean, will it
> freak out the security guys?
The only thing I noticed was the security dude at Dulles
asked to look more careful at the AR8000. He asked me what
it was and to turn it on. If it is electronic and has
batteries it must be demonstrable that it works. Why?
Why not worry about my shaver etc?

I would have figured he should have been more interested in
the bag of batteries I was carrying or the large black steel
MAG light which would make a neat case for a cheap pipe
bomb.

When they get to the point about asking you if anyone has
given you a package to carry, I like to say only a little
one from Habib as a favor for his mother. They always say
really now we are serious, no joking around. Why can't they
accept I would do a favor for any foreigner as a friendly
dumb American?

Security is very spotty and even the security at Hartsfield
had a fatal flaw in it as proved as recently as this last
weekend by my wife who boarded a plane without ever
surrendering her pass. She handed it to me later and asked
what she should do with it. The boarding pass was number 13.
She had been in the women's lav when they boarded. She just
ran on board to avoid missing the flight.

That would have been a perfect number to sell to some
terrorist or suicidal fruitcake bent on blowing a plane out
of the air.

BTW I returned it to the airline when I passed through
Harstfield this last weekend.

I was under the impresssion that Bose had active noise reducing headsets
for pilots for years.
They seem to be very popular with helicopter pilots.

Yes, the PRO-51 does a limit search. Pretty handy.

: Interesting idea. Here in WA state, the reservations sell fireworks that are illegal in surrounding communities.

I'm not a lawyer or an Indian, but I believe that the reservations *are*
subject to federal laws (but not state, or county laws). A Navajo man was
recently tried in US District court for murdering his family on the
reservation - not in a Navajo tribal court, or in an Arizona state court....
Since the sale of cellular capable scanners falls under federal law, I'd
think that it would still apply on the reservation.

Presented as a public service. Please pass to your cellular-phone-equipped friends.

Cellular Telephone Security FAQ, v1.0

Originally posted to SCAN-L by Harold Peach.

Q. Isn't listening to radio communications, including cellular, an invasion of the participant's privacy?

A. No. The public's expectation of privacy when using unencrypted radios or cellular telephones is unrealistic and rooted in misconceptions about the nature of radio. Unlike wire and fiber optic mediums, which are privately owned and truly private, the radio spectrum is a public medium. Radio is public in that it is a public resource, like a park or street and, it is also public in that all activities carried out there are done so publicly. When people use commonly accepted methods of radio communication (whether analog or digital) that do not include encryption, there is no reasonable expectation of privacy. No law can change this fact. Communicating via radio is metaphorically the same as shouting across a crowded room.

Q. But don't the nation's telephone users have a right to privacy?

A. Yes. Callers have a reasonable expectation to privacy when using the telephone. However, when those telephone conversations move from private mediums to the public medium of radio the nation's telephone companies have an obligation to protect the content of those conversations through encryption. Only then does true privacy exist.

Q. How can congress act to ensure the privacy rights of the public are protected?

A. By passing legislation requiring telephone companies to encrypt wireless telephone communications. And, in the interim, by requiring that callers be warned when their privacy can not be ensured because their conversation will be traveling unencrypted over radio.

Q. Isn't encryption expensive?

A. Encryption is neither prohibitively expensive nor technically impractical. But even if encryption were not feasible, it does not change the fact that without it, radio communication privacy can not be expected.

Q. What good is encryption? Won't someone always be able to break any cipher invented?

A. It is true that for any technical method of concealing something there will always be someone who can break it, but this is a separate issue. When someone takes reasonable steps to encrypt their communication they have a reasonable expectation to privacy. When someone breaks that encryption and listens to the communication, they invade the person's privacy and violate existing laws. Not because they intercepted the signal, but because they broke an encrypted communication to which they were not a party. Metaphorically, this is equivalent to holding a glass to the wall or opening some else's mail.

Q. Even if we acknowledge that encryption is the best solution, isn't banning scanners a simpler way to solve the problem?

A. Scanners are radio receivers that can be programmed to listen for activity on several frequencies. Even if outlawed, it does not require an engineering degree or a high degree of electronic knowledge to build a radio receiver so we should never assume outlawing their manufacture or sale will prevent people from obtaining them. Even a television set can receive cellular telephone calls!But the question misses the point. Banning radio receivers to prevent the monitoring of radio communications is metaphorically equivalent to requiring people to ignore a public conversation taking place before them. Common sense tells you this won't work.

Q. Aren't radio hobbyists really just high tech voyeurs, eavesdroppers, or, as the Cellular Telephone Industry Association has called them, "electronic stalkers?"

A. No. Is it unethical to listen to two people yelling at each other across a crowded room? Is it voyeurism to observe the signals of a coach at a ball game? Radio hobbyists are ordinary people sitting on the sidelines of the public radio spectrum, watching and listening to the events unfolding before them.

Q. If the radio spectrum is truly public, why do we have licensing and auctions?

A. The Federal Communications Commission only licenses radio transmitters, not receivers. It does this to ensure the orderly use of a limited resource - the radio spectrum. However, neither licenses nor spectrum auctions convey ownership of a frequency or band, they only convey permission to transmit over the resource. Reception of radio signals does not interfere with the orderly use of a frequency or band so no licensing is required. Restrictions on radio reception traditionally occur only in countries with repressive forms of government.

Q. Do radio hobbyists support the Electronic Communications Privacy Act?

A. The ECPA protects many forms of communication from unauthorized eavesdropping. Everyone agrees with its provisions involving private mediums such as wire or fiber optic cable. It is only the radio provisions of the act, included as a "paper tiger" to primarily benefit the cellular telephone industry, that most radio hobbyists consider bad and potentially dangerous law.

I dunno. I think its pretty dull listening too, but so what? Are you
going to declare that cellular phone listening is dull, so we
shouldn't listen? Sometimes those "folks with no life" really do hear
some interesting stuff. Consider it like a fishing expedition, or
like channel surfing on TV. Most of that's pretty dull too, in my
opinion.

John, are you suggesting that we give up on that which is
already lost? That's the "balony game"! The government
takes just a small slice, and thats really not enough to fight over.
Then they take another , and then another, , , Then the next thing
you know, you are left with only a little slice, and THAT's not enough
to fight over either.

You can see these same tactics with the slow, piece meal elimination
of smoking in the United States. First, they took the ads off
television. Then they required a label saying that smoking is bad.
Then they restricted smoking on commercial aircraft. The next step
will make it illegal to smoke anywhere OUTDOORS!! They won't just
flat make cigarettes illegal, because they know thet they wouldn't get
away with it. THAT's the "Balony game". (BTW, I'm a non-smoker.)

I will dam well listen to ANYTHING I want to listen to. And there
ain't no dam gummint gonna tell me I can't. :)

THAT'S REALISTIC.! And I CAN smell the coffee. And the government
wants to take THAT away too.

They'll get my scanner when they pry it from my cold, dead hands.

You can get a voice operated tape recorder, or there are units that
operate your existing recorder when audio is detected....Pop
Electronics and similar mags advertised a unit called Nite Logger or
something to that effect that does what you want to do.

Message-ID: <01bc177d$da02d1e0$31cd93cf@chrissie>
Source record: 208113

My old 10ch analog (49MHz?) cordless phone was great, until a noise appeared last year that I couldn't identify. I wish I'd have recorded it. Anyway, it sounds like another phone changing channels. But it happens about every 30 seconds, and sometimes twice. Really annoying. Like a scratchy beep at about 850Hz.

Any guesses?

If anyone's curious enough, I'll borrow a neighbor's phone, record it and post it.

P.S. I sold the phone to a friend who lives a short drive away. He doesn't have this noise in his area, and he got a great deal on a cordless phone!

Yeah, this is a can of worms that few legislators want to face.
They're going to have to deal with it sooner or later, though.
Eventually I expect that encryption will become commonplace --if only
because the public will ask for it.

NEXT: you cannot smoke in bed...a law
: you cannot smoke in bed having sex...a threat

Pretty soon it will be against the law to have
matches or lighters....then no one smokes. Like
what they did with good ol' Maui Zowie and the current
stuff...it's against the law....why? I don't know.

But then they outlawed smoking pipes and pot parephernalia.
If you had it you were guilty of something....

That sentence is the esseence of totalitarianism: you are
therefore guilty of something which we are not arresting
you for.

But I think we already do this. Get a briefcase and put
120,000 dollars in 20's and 100's and go on a trip. Pay
your expenses as you go and do it from the briefcase.

How many miles do you think you will get from home before
you get arrested for something which the law cannot prove,
but assumes you are guilty of.

We already do it. It's being done.

and the Clinton guy is doing it to us also: he allowed the
do not discuss how togive an abortion via the Internet part.
He just was not instructing the justice dept to honor it.

Get that: a law is signed restricting free speech and woman's right to know and be serviced and this "saviour" of the people signs into law that part...which clearly made criminals of any person who would "ask how to get an abortion." Or how to not get pregnant by using anti-pregnancy useful stuff...like foam or jelly or RU-486 or etc's.

ain't democracy wunnerful with our BILL OF RIGHTS as inviolate.

question mark?

bill conduit

My personal experience is that manual "discharging" works just fine and
it DOES extend the life of the battery and allows for more effective
charge effeciency and "up" time... Special discharging devices are not
really necessary and in fact I have never seen these avaiable locally.

"Battery Memory" is far from a myth. It is a documented phenomenon, and
there IS such a thing. In particular, I have seen it discussed in the
Uniden BC-200XLT (which uses a 7.2 V Ni-Cad detachable pack) manual,
just for starters.

Ni-Cad's need to be discharged fully once in a while in order to effect
a more efficient and longer lasting "up" time between charges. Most
folks in the real world who have a lot of experience with Ni-Cad's
"cycle" in this fashion and discharge their batteries once in a while.
It's not necessary to do it all the time though...

Regards,

Sean

Bruce, here's an idea. In WA state along the Columbia River, there is the "Indian Territory", can't remember the Tribe's name, but it is a sovereign area. I have a friend that lives in the territory, and his driver's license is issued from WA state, but it doesn't say WA in his address, but rather "Indian Territory", and the appropriate zip code.

He fought with WA State and the Federal Gov't over it but won because nowhere could the Feds find any proof of legal settlement in the annexation of the lands from the Native folk. Therefore, the land is truly sovereign and they could probably get around the cellular ban. Anyone in the Indian Territory or Vancouver, WA care to do some homework on this?

There's gotta be a way to beat the arrogant Feds at their own game!

Happy scanning,

Jon

After seeing some good prices on RS brands, I bought a 2045 (nice features, btw), got it home and plugged in.

To my amazement, everything around the 900mhz was BLANKED OUT.

My BC220XLT picks up 911.4625 mhz (local tv station) VERY clearly, but the 2045 gets only static.

Here's how bad it was:

Bearcat 220 - NO ANTENNA. Clear, crisp sound from the station.
Pro-2045 (and Pro60) hooked to my scantenna setup on the roof...
nothing but static.

And if I moved up to 920 or so, both worked the same. Well after some experimentation, I found the RS radio picks up NOTHING around 900, even strong signals.

Whassup with that??!

I took it back and exchanged the base unit for a Pro60 handheld. Same damn problem. Are these purposedly blanked out at 900 to avoid cellular images and cordless?
What a piece of shit...

So, the nice uninformed Radio Shack salesman did come in handy - he happily refunded my money so I could order a Bearcat 9000 from ScannerWorld. It just goes to show - RadioShack salespeople DO answer questions - like "Where do I need to sign for this refund?"

By the way, if you haven't checked it out:

http://www.policescanner.com

Awesome site!

The problem is mostly the Bearcat 220, not the Pro-2045 or the Pro-60. You are hearing images on the 220 that the Radio Shack scanners don't hear. WHY? Because the Radio Shack scanners are both triple conversion, the 220 is dual conversion, therefore the image of any particular frequency will appear at different places on the Radio Shack scanners than the 220. I'd try and verify what you are hearing with several different scanners.

The best clue here is that TV stations don't broadcast on 911.4625 Mhz, the actual frequency is much lower. What channel # is the TV station? Once we know the channel, we can find it's audio frequency and do the math.

If it were me, I'd teach the Bearcat 220 how to swim and go back for the Pro-60, a superior scanner in my opinion.

That's not to say that the Radio Shack scanners don't have reduced sensitivity at 900 to 920 Mhz because of cell images, they might, but I had a Pro-26 that images of cell phones were very strong right above 900 Mhz.

I don't have that problem at all with the BC-9000, 2004, or AR-8000.

Hope that helps.

1327. New AOR-AR8000 For Sale

Newsgroup: rec.radio.scanner

Message-ID: <01bc170c$b2d6cfc0$309c9ccc@radon.haus-net.com>
Source record: 208139

If anyone is interested I have a AOR AR8000 for sale. I bought it about a year ago from Grove and have never really used it. I like it alot, but you can
only listen to so many radios at once. It has the "Mod", and also has the Scout Mod on the side of the radio. Here are the details:

AOR AR-8000 (New Condition)
Pre-Modified for Scout
Original Manual
Scan Cat Gold Software
OptoElectronics CX12 RS-232
Interface Converter for AR-8000
Original Antenna
CH32 Miracle Baby Antenna
Entire Package: 550.00

All of the accessories allow you to control and upload and download your band plans to the radio. I live in the Silicon Valley area so keep that in mind when replying. Thanks.

My BC-210 will not stop scanning on VHF-low frequencies above about 46
MHz, even though it works fine in the manual mode. It's been that way
since I bought it (about 20 years ago). My "fix" was to program the
VHF-low frequency in two successive memory channels. The scan stops
on the second. If I want to scan several VHF-low frequencies above
46 MHz, I need only program the first one twice provided they are all
grouped together in consecutive memory channels.

Just wanted to bounce off this idea of mine...
Since the US government have decide to ban cell capable
(newly manufactured) scanners from being sold. Perhaps it is
legal for shops on Indian lands to sell such scanners ? since,
they're soveign nations, and does not have to obey US laws.
Is this plausible ?

Have you ever heard or seen typed in a newspaper story or tv spot
about "crooks caught listening to scanners and get an extra 6 years
for each scanner they had programmed to police and FBI and SS and
HP and DEA and Customs and Sheriff and others they could not find
because of the fire which the crooks set to hide their tracks....

Have you?

Think about it....

Followup to the above ... the recommended method of cutting a Larsen (or other) rod is to use a pair of bolt-cutters with hardened steel cutters (Larsen has a special tool that they will sell you that is similar) ... lacking that, notch the rod with a triangular file (or the corner of a rectangular file) about half-way through, and "snap" the rod ... if you take your common wire-cutters and try to cut the rod, you will end up with a nice indentation in your wire cutters, and will have modified them to be nice wire strippers (for all those who are always looking for "modifications" to things!).

Larsen (and most other antenna manufacturers) use a hard stainless alloy for their whips, with some sort of more conductive plating over that (creating what Larsen calls their "Kulrod TM".

73 to all! (And thanks to Charles for his post!)

-Just wanted to bounce off this idea of mine...
-Since the US government have decide to ban cell capable
-(newly manufactured) scanners from being sold. Perhaps it is
-legal for shops on Indian lands to sell such scanners ? since,
-they're soveign nations, and does not have to obey US laws.
-Is this plausible ?

Interesting idea. Here in WA state, the reservations sell fireworks that are illegal in surrounding communities.

hello anyone,

i'm searching a service-manual for my AOR scanner. our local importer here in germany wants to have 130DM (90 US$) for it. maybe anyone knows a cheaper source ??!!

thanks Ludger

I'm using the Optoelectronics OS535 with my Pro-2035, and Probe v2, and it works great as well.

Good luck.

Stephen,
I have a 2035, and yes, the humming is normal. The power supply
transformer is always energized when the unit is plugged in, powering the
memory. Transformers tend to hum, and there is nothing wrong with it. I
think you made a good choice in buying the 2035. I have it with an OS535
computer interface, and it COOKS!

Sincerely,
Robert McIntyre

Source record: 208159

Does anyone know of a program I can download or buy that will allow me to use my sound-blaster compatible computer sound card to decode and display CTCSS tones on the screen? The concept seems simple enough...use a low band-pass audio filter system, and identify which tone (under a certain CTCSS high limit) is coming through. Seems simple, but has anyone done it? Or, better yet, heard of a program that does it?

I won't tell you to read the manual but if you look on the back of the
scanner by the power and charge jacks, the DC voltage and polarity are
embossed on the plastic case. It requires 9 volts, tip (center)
negative. Radio Shack sells a universal vehicle DC to DC adaptor with
selectable voltage output and an assortment of plugs.

people able to listen to a Radio.

That is basicly what a Cell Phone Is...a Radio able to transmit.

They are treating it as if it's a closed-ended source, like
wire or phone-tapping.

Listening to a radio will get you in Jail and a fine.
How much we are legislating outselves into the mirrored ways
of China where listening to radio is a crime...unless it's
Radio China.

The more the politicians cry "protecting your right" the more
freedom we seem to lose. IT's always based on some legislation
that restricts your freedom to find out.

All this fuss over a Radio.

All that power outside an aircraft will mostly only get in via antennas which are fed into selective filters in the receivers, if not before. Inside the aircraft the signal can find it's way into all sorts of strange places.

It takes a pretty good imagination to see how a cell phone could affect an ADF, I'll grant you a maybe on the TACAN but it will be a long time before you see an airliner with TACAN (I know, I know, DME; but I couldn't resist the shot).

I have seen a two watt 2 metre ham handheld raise havoc in intensive care, it was part of a controlled test to see if we could hook a sick kid up to Santa Claus.

I have personally crashed an automated Air Traffic Control RADAR system with the same handheld. No problem outside the building where the only route is via the antennas, but inside the shielded room the displays just turned to garbage. Again part of a controlled test.

Inside an aircraft is analagous to being inside a shielded room.
Can you imagine the cost, and the weight penalty, of shielding and filtering *every* wire and cable in an aircraft?

The communications systems in hospitals and ATC units have been tested and approved for use in their environments. But consumer stuff is unpredictable.

I called a couple of mail order houses to check on prices for a SportCat. Ace Comm. has it for $149, Racescanner.com has it for $169. When I called and asked them about it, they said that it was audio enhanced and that was the reason for the price difference. My question is, what does "audio enhanced" mean, and can a retailer do this and not void the manufacturers warranty? TIA

First, the manual can be ordered from the UK distributor. I don't know
of an on-line manual.

The only programming software is sold by Yaesu, and developed by RT
Systems in the US. It is the ADMS-1C software which includes a RS232
connector that connects to the mic jack of the FT-50R.

For a great link to a webpage that supports the 50R, here it is!

f>Has anyone done business with Scannerworld and are they reputable? I
f>want to buy a sportcat 150 and find their prices about $40 less than
f>any of my local dealers.

I haven't bought anything from them for a few years, but that's mainly because until December I hadn't bought a new scanner in several years, but I have always found them to be very reputable and reliable. I've called in the early afternoon and had items delivered by regular UPS within 24 hours. Their prices have always been competitive, and I have never gotten a bad product from them. The only negative, if you consider it one, is that they don't have an 800 number.

1367. What's next from the FCC re scanner laws?

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: johng@comm.mot.com
Message-ID: <johng-ya023180001102971845530001@news.cig.mot.com>
Source record: 207830

After watching the House Commerce Subcommittee hearings over the weekend, I wouldn't be surprised if a new FCC Notice of Inquiry (NOI) will propose the following:

1. FCC rule change to require standards for IF image rejection for scanners. These standards will need to be met prior to part 15 type acceptance of new scanners.

The CTIA is upset that image reception is being used to receive the blocked cellular band.

At the hearings, Gary Shapiro (Consumer Electronics Mfgrs Assoc) says that Uniden has sent a letter to the FCC recommending standards for image rejection on scanners. Although I suspect that the FCC will leave implementation details up to the manufacturers, it is likely that higher frequency IFs will be used so that filters can be used to attenuate the undesired cellular images. This design change to some new scanners should also have the beneficial effect of blocking other undesired images in other bands.

2. FCC rule change to require "hardening" of scanner internal circuitry prior to part 15 type acceptance.

The CTIA is upset that the bandpass filter selections in scanners are being modified (CTIA President Wheeler's opening demo) so that undesired images are not properly attenuated. This allows images of cellular frequencies to be received on other "legal" frequencies.

Richard Smith (FCC Enginerring and Technology Office) told one of the Congressmen at the hearings that the FCC will "Look in to" hardening scanners to prevent tampering with the filter selections. Hopefully the scanner manufacturers as well as scanner consumers would fight this proposal, since it could make any repairs to a broken scanner difficult, it not impossible. Any other "legal" modifications to a scanner might also be made difficult by a rule such as this.

It is interesting to note that Mr. Shapiro of the Consumer Electronics Manufacturers Association, reports that the scanner industry in the US sells 700,000 scanners each year. They estimate that 10,000,000 scanners are in use in the US. With sales volumes at this level, significant consumer electronics industry profits are also at stake. With the large number of law abiding, "couldn't care less about cellular listening" Americans owning scanners, the Congresspersons are aware that the CTIA isn't the only interested party in this issue.

One of the Congressmen mentioned that he didn't want the cellular privacy question to turn into a repeat of the CDA (computer decency act) fiasco.

I live in the tampa area, and it does totally suck that one of the biggest, if not the biggest agency in the area is going trunked. What type of trunked system will they use? Can uniden's new trunk scanner pick it up?

Tony

I was told it wasn't when I had my Pro-2026. I opened it up and could
not find any connectors where the CTCSS board or Pre-amp option board
might plug in.

> I know the performance on the Pro-2026 isn't that great, but I needed something
> small and inexpensive for my car to augment my UHF only mobile.

I had a lot of problems with Cell-phone, pager system, and some
GMRS-type noise bleeding into every 400 and 800Mhz frequency that I
programmed in. I only listen to public safety freqs, most of which were
in these bands, so this was quite a problem. I traded my 2026 in and
got a mobil model that has triple-conversion, and most of my problems
went away.

Well, there's even more then that.
Social Security and many insurance actuarial tables, as well as pension plans are designed around a certain number of people only living a certain number of years.
Think about it...If all those that currently smoke, gave it up and lived into their 70's, 80's, and 90's, this would wreak havoc with those plans and they could be bankrupt well before their time.

1378. ADVICE: triple conversion handheld scanner

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: rwallen@epix.net
Message-ID: <5dqkcf$4i4@news1.epix.net>
Source record: 207880

Seeking recommendations for a handheld scanner (receiver only) that will fulfill the following:

VHF-low, VHF-high & UHF (800 not necessary)
Programmable, at least 50 channels
Triple conversion
Designed for factory-supplied nicad battery pack

Who makes it, how reliable is it?

We currently have a fleet of Motorola GP-300's on UHF but due to channel expansion need to monitor a lot more freqs, don't need to transmit on most of them, and don't want to buy all new transceivers.

Please reply to my Email directly since I think my internet provider never gets most of the Usenet traffic. Post here also if you wish. Thanks in advance.

for the most part they give good service...and low prices
but for some reason they don't mail out catalogues...and
if you buy from them they forget about you by not sending
you current sales they have or stuff that Scanner Workld
and Grove does every three or four months....

Ace just assumes you and everyone else reads the mag's
they advertise in...I don't ... so I deal withthe
companies who want my business....and send me up to date
stuff.

but they are well-known and have a good rep...

bill conduit
used to buy from them long ago til they forgot me.

Has anyone tried one of these yet? I'm mainly interested in knowing if they have eliminated (or at least reduced) the nasty sidetone in the 9100 and 9600 models. Also, is the range really as good as they say? They claim twice the range of the 9600, up to 1 MILE! I was wondering what the 'real world' range is.

I own a Toshiba FTH955 which is almost certainly the same as a VTech 900 NDX. 10 channel digital 900 Mhz. Range is about 500 ft or so. Good sound quality. No detectible sidetone. I tried an Escort 9100. Only advantage was better range (600-700 ft). Sound quality was good other than the terrible sidetone. Poor ergonomic design, IMO.

: What about the "Mom, I did it. I killed her!" cell conversation? Or is
: that an urban legend?

Since the chase was a long drawn-out affair and the news of it interrupted regular programming to make sure everyone knew it was happening, at least a few people (if not hundreds) must have made a mad dash for their scanners to check it out. If the Martins could just chance upon Newt's call complete with tape recorder, how much more likely would it be that someone managed to snag O.J.'s call? Especially since many of those roving reporters must have been rather capable scanner users. Maybe tape copies of that call are languishing in newsrooms across the country, just waiting for someone to take the legal risks of broadcasting it.

====================== ok Andy HERE IT IS ==============

Well, I spend 15 minutes in the library today and found the following - I am only quoting sections 184 and 191 in full, if you want the full story go to your local library and ask for the 1997 edition of Martins Annual Criminal Code.

Section 184 (1) Everyone who, by means of any electro-magnetic, acoustic, mechanical or other device, wilfully intercepts a private communication is guilty of an indictable offence and liable to imprisonment for a term not exceeding five years.
<subsection (2) lists exceptions which are for consent by the communicators, by a peace officer with authorization, by service providers or government spectrum management personnel in the performance of their duties>

Section 191 (1) Everyone who possesses, sells or purchases any electromagnetic,
acoustic, mechanical or other device or any component thereof knowing that the design thereof renders it primarily useful for surreptitious interception of

private communications is guilty of an indictable offence and liable to
imprisonment for a term not exceeding two years.
<same exceptions as in 184>

A 1975 ruling exempted police communications on the grounds that the police
are aware that the public own radio receivers which enable them to listen
to police communications and are therefore not entitled to protection.

Section 193 (1) provides for a two year sentence for disclosing the content,
or even the existence, of an intercepted communication.
Section 193.1 (1) specifically applies the above to radio-based telephone
communications and the synopsis thereto gives cellular phones as an example
of the communications protected.

Section 194.1 (1) permits a court to order payment of up to five thousand
dollars as punitive damages to the person whose communications were
intercepted.

Yes! Through the magic of the Internet and FTP, I am now proud to offer you...the distinguished readers and participants of Usenet...the opportunity to download five newly created and digitally mastered sound files! Hear for yourself why I affectionately refer to 3894-dot-5 as "The Zoo of Amateur Radio." Just
listen to what you get:

1) BIG-AL-SAT-NITE-LIVE...Hear Big Al, "cranked up" and ready for a night's entertainment as he encourages and provokes his arch-rival "Pork Butt!"

2) PORK-BUTT...Listen to Pork Butt return the fire! Featuring the famous "white trash in America" monologue.

3) PIG-PEN-PETE..."HO HO, HO HO, HO" Here's our friend Pete, getting in his two cents' worth...and being severely admonished by his fellow amateurs for his efforts.

4) RALPH-THE-THIEF...Check out Big Al's response when he discovers Ralph's attempts to wreak havoc on his reception by transmitting the sounds of a BABY CRYING in Al's neighborhood!

5) THE-JAMMING-STOPS...Pork Butt on the offensive, commenting on Al's latest attacks.

It's amateur radio at it's best! Hear for yourself what I've been talking about on this forum. All original hits by the original stars of 3894.5 that made 'em famous! Digitally mastered for optimum sound quality and available NOW via your modem at the following FTP site:
members.aol.com:/mnmaniac/3894.5

Don't delay! Download today! And thanks for yer support! :-)

1400. California Highway Patrol (CHP) mobile extenders & BCT7/12

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: award@cisco.com
Message-ID: <5dqt4a$dlq@cronkite.cisco.com>
Source record: 207902
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone have knowledge (I'm sure you do!) on whether the mobile extenders are continually producing a carrier that can be detected, or only when the officer keys up? Or is just whenever he (/she) is keying is receiving a dispatch? Does it work when in OR out of the patrol vehicle?

Obviously, I'm trying to figure out if the Bearcat BCT-7 & BCT-12 are effective only when there is comm traffic.

Also, if you know of the BCT-7, does it have an indicator of the extender signal strength, like the BCT-12 does?

Feature for feature, what do you think of these two radios?

Thanks

1401. Radio Shack Discone Vertical Element Mod

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: David Hitchner <hitchner@worldnet.att.net>
Message-ID: <01bc1874$a1c5d0a0$f86593cf@hal>
Source record: 207903

I have seen several request for a vertical element mod to the Radio Shack discone. I decided to give it a try for myself. It only cost my about $9.00
and some time.

Needed Items: Radio Shack Stainless Steel Replacement Whip 21-952A
1/2" Aluminum Rod (about 3" long)
1/4"-20 Thread Tap
5/16"-18 Thread Tap
Appropriate drill bits for taps

Assembly: Drill and tap each end of the rod.
Remove the cap and top nut on the discone.
Screw the rod on top of the antenna (5/16" Tap).
Screw the whip on the rod (1/4" Tap).

I found that after added the vertical elements CB reception improved noticeably
and the signal is stronger on NOAA weather. I can now also receive the local
airport ATIS. I have noticed no loss in the 800Mhz range.

From what I can tell the vertical element helped the low range without any loss
on the high end. Only time will tell if any problems crop up. Not to bad for a small
investment.

That's that same conclusion that I came to also. The 35.02/154.600
are the older units which operated with about 2 Watts of power. Some
of them could be heard from over a mile away!

1406. 800MHZ DOWNCONVERTER???

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: Charles Simmont <simmont@doitnow.com>
Message-ID: <330119B3.4CEA@doitnow.com>
Source record: 207908
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am getting a BC 100XLT and have been told that the mod for this scanner to recieve 800 Mhz is either too expensive or impossible. So i am considering a downconverter for this unit. What i need to know is how it will effect my reception of other freq's, how relaible is it, prices, & dealers? I already have several scanners w/ 800Mhz, just adding this one to my collection.

I would suggest that you ask the pilot if he would put the aircraft
radio on the headset for you to listen. Try to do this before the plane
takes off.

This way you do not have to figure out what frequency to use. It is also
againSt the operating policy to operate a radio of this type on board
the plane while in flight.

There used to be a list of DPD 4 digit element numbers for CAPERS, PES, Youth, etc. You wouldn't happen to have that handy? I also havn't heard any mention of the "N" codes on the air for a while. The only one I remember was an N9, which I think was for either a DWI/AUI service number.

1419. Pro-2027 Problem?

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: tpenn@netcom.ca
Message-ID: <32fff486.40265766@nntp.netcruiser>
Source record: 207921

Hi,I have a Pro-2027.
When I listen to my local
trunked system(800 MHz),
I get severe bleed over from
cellular telephone calls.
I don't want this!
With this scanner I basically
can't hear what the trunked stuff
gRRR!(It does come through,if u can get a break from the cell.!)
You may think that I'm REAL close
to a cell tower but I'm not.
I'm quite far from the closest tower.
I use the supplied pop-up antenna.
What could possibly be wrong with this
scanner??
Typical frequencies used in my trunked
system for example are:
862.8875
862.9375
862.5375
863.4875
863.7375
865.9875
and so on.
I hope this is not a normality
of this scanner.
I've heard negatives about Uniden dual
conversion scanners before,but this problem
leaves me with an unusable scanner (in the 800's)
Scanner works well in all other areas of the bands.

Any ideas?

Thanxx for any input
you can give me!

Yep. But the DSP's present in voice modems are also very powerful and
can decode DTMF tones reliably. So the question is still open
regarding SB cards.

Hello, I have the following scanner items for sale/trade:

1. Bearcat 855XLT 100 channel mobile/base scanner with full
800 MHz including cellular. Works well. $110.

2. Radio Shack Pro-2036 200 channel mobile/base scanner with
800 MHz including good images of full 800 MHz. Like new. $180.

Will consider trades on newer (486+) computer stuff.

>Has anyone done business with Scannerworld and are they reputable? I
>want to buy a sportcat 150 and find their prices about $40 less than any
>of my local dealers.

My opinion of Scanner World is that they suck. I will NEVER deal with
Scanner World due to the poor treatment I received from them in 1988.

On November 26, 1988, I ordered a Regency Z-60 scanner which they had
advertised in Monitoring Times for $109.99. I also ordered the Z bracket
(for mounting the scanner) for $5.99. The shipping charge was $10.00

On December 5th, I received via UPS, the Z mounting bracket and a Z-30
scanner. The Z-30 contains 30 channels while the Z-60 contains 60. The
Z-60 also has FM Broadcast and VHF Aircraft coverage while the Z-30 does
not.

I called Scanner World and received a return authorization. I requested
an exchange for the proper scanner, and reimbursment for my cost to ship
the scanner back to them. I shipped the scanner back via UPS which cost
$3.88.

On December 16, 1988, I received a credit slip crediting my Visa for
$109.00. This was not exactly what I asked for. It certainly was not
what I asked for, and if they were trying to rescind the sale, I certainly
was not made whole.

It took me a couple of days to get through to them via phone because
I was on the West Coast and they were on the East. On December 20th,
I reached them at 6:15 am Pacific time. The first person I spoke to,
an order taker, informed me that the credit slip was to be considered
my refund. If I wanted to, I could reorder the scanner. This was not
satisfactory to me. I asked for a manager.

A Mrs Lyons came on line and we discussed my situation. At this point,
I no longer wanted to deal with Scanner World any more. I asked her to
make me whole again... the existing $109.99 credit slip, the 5.99 for
the bracket, the 10.00 for the S&H charges, and the 3.88 it cost me to
send back the scanner due to their mistake... total $19.87.

Mrs Lyons became very defensive and informed me that it was all my fault.
The analogy she told, was one of going into a Kmart and trying to return
ann item which you bought which was the wrong size, and expecting Kmart
to pay for my gas to get there. While this logic might work, had I
originally ordered and paid for a Z-30 and later decided I really wanted
a Z-60, it does not apply in this case, as the mistake was entirely theirs.

After that call, I sent a letter I had written the previous day, to the president/owner of Scanner World, and a separate copy to Mrs. Lyons. What I had written in the letter, was similar to the above explanation of what happened. I then continued with:

What I am asking for is not too difficult. First let me know how you plan to remedy this situation, and then either credit me for ALL my expenses, and send for your Z bracket and we are through! OR send me the Z-60 scanner and charge me against the credit for the $109.99 less $3.88 for me to return the wrong scanner back to you.

If neither of these are satisfactory to you, then I shall be forced to communicate directly with Visa and have the transactions involving your company pulled from my charge account. That would be fair to me.

Please inform me of your intentions. So far, my first experience with your company is not too pleasing, and I do not know if I will ever deal with your firm again.

I never heard from them. On January 13, 1989, I filed a Statement of Dispute with my bank over the incident. My dispute was for $15.99, my loss minus the $3.88 UPS return charge.

Now it gets HILLARIOUS!

On January 23, I received a letter from my bank informing me that they credited my account $109.99... I wrote my bank back on January 27, telling them that their credit need only be for $15.99. I never heard anything back from the bank... UNTIL...

[clock ticking sound]

September 8, 1989 I receive a letter from my bank. It includes the letter I wrote to them on January 27th informing them of the overcredit, and begins:

"I have been notified by the above mentioned merchant's bank of a processing error in posting a recent dispute adjustment."

All in all, my bank was telling me that they were charging my account $94.00 in order to make my credit exactly what I had asked for. My bank had also included a notice that if I felt that the adjustment qualified as a dispute under the Truth in Lending Act, I could notify them in writing. I assume that the bank was asking me for the $94.00 and that due to the lateness of catching the mistake, I could have fought it. I did not... but it made me smile to see that Scanner World had to fight to get their account straightened out. :) :) :) :)

Scanner World never did send for the Z bracket... I think it's lying in some scrap pile somewhere... not much good for anything else.

Now there's just that $3.88 shipping mistake, and the lousy customer relations they had towards me... so...

[train going through tunnel]
[Delta rocket launch]
[Pile driver driving]

SCREW YOU SCANNER WORLD!!!

BWHAHAHAHAHAHAHAHAHAHAHAHAHAHA

Lets see... I guess that's about $0.25 worth of goodwill.

BTW: If Scanner World is reading this, and is thinking about filing
any sort of suit for libel or slander, let it be known to the
lawyers that you introduce to this, that the "SCREW YOU" is my
personal statement to you, and that all the statements above
are true, and I still have the documents to support everything
which I claim, and it is my personal opinion, which is based on
my experience with your company, that you suck.

The effect he is talking about eventually kills cells but it doesn't
produce the non-existant "memory effect". The only thing those
tendrils do is short out the cell but that only happens with old
cells. Discharging a large capacitor into the cell will sometimes
revive it but that's hardly worth the effort. I've revived a few that
way but they eventually die again shortly thereafter.

I need help in deciding on which of these three to buy:

Pro-43 (Cell mod capable) for $200, used of course
Pro-51 on sale at RS for $199
Pro-60 on sale at RS for $249

Any comments or suggestions, both good and bad, would be greatly
appreciated!

Thanks!

Oh no! Someone with a "thing" against the PRESS.

I think it's called servicing the public with info
which the Press has access to when at a scene where
news is being kept for use later on by those who
read it or see it.

but the Press is not always allowed to "GET IN" to
a scene...the cops and like invent reasons to not
allow the media in. I guess this fact makes you
very happy ... sadist.

Wow...gee...gosh...wallah wallah bing bang...

Think of what you just suggested us doing. Having to go down to
a RS store, get a dist manager number, then call him and call him
and call him because he don't answer his phone or his answering
machine takes over and then he never calls back because he's at
some Groundbreaking Ceremony for another RS store.

why not just pay the employees more...
why not train them better
why not give them bonuses each month
why not make sure they can speak english
why not make sure they don't have this "you need me" attitude
why not make sure they know how to say "I don't know"
why not allow them to think on their feet
why not give them a video to learn from
and more etc's

the onus is on management to hire the best
what do you hire?

Some people just don't want to do the research. You can find all sorts of sources for the "memory" effect. If you look far enough, you can find sources explaining why it's not a factor in normal use. Some of those sources have been referenced here, and you can find your own sources by searching on "nicad," "memory," "Gates," "GE," and "NASA" on Alta Vista. I've done those searches, as well as talking to many people over the years. The ones that know what they're talking about all agree that the memory effect is not a factor, and, in fact, is almost impossible to simulate, even under lab conditions.

The facts are out there. It's not our fault if people choose to ignore them in favor of "conventional wisdom."

1435. Is the AOR AR3000A worth the cost?

Newsgroup: rec.radio.scanner
Date: 1997-02-11 00:00:00 UTC
From: efricha@alumni.cs.colorado.edu
Message-ID: <32fff6ce.9726576@news>
Source record: 207937
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Greetings, all...

I've just started getting interested in scanning and want to get a good one. I've been mostly interested in a "DC-to-daylight" type since I also listen to shortwave radio.

Unlike my SW radio purchase, I'd like to start out with a high quality piece of equipment that is (relatively) affordable. It looks like the only possibilities in my price range are the ICOM R10, AOR 8000 and AOR 3000A. It seems that the 3000A best meets my requirements.

Is it worth the cost?

Would I be able to replace my FRG-100 with this radio for SWLing? (Primarily ham and utility)

Any input would be helpful!

Thanks much,

--

>numbers Any ideas?I tried the 13vt supply and it gives me the same
>when powered by DC.Any help would be greatly apreciated.

Could be any of the following: Q204 (unlikely, I think it would show an invalid freq, not random 7's) C114, a 4.7 uF, 35 volt tantalum capacitor, failure will cause display to blank. There is another cap in the power supply, don't remember the designator at the moment. One of these caps is the most likely cause.

IC6, Exar NC57902 divider chip may have failed, in which case you'll have to beg, borrow or steal one. Not available from Uniden any longer. Not sure that's the problem either, it would probably show only a decimal in the rightmost digit, at least that's my experience.

It is common in many of the older Bearcats to have the display go blank, but the squelch appears to work and noise is heard in the speaker. This is usually a problem in the switching power supply.

Might be time to locate a junker 250 for parts.

Good luck,

Jon

: W 122* 18'
:

The poster wanted to monitor 2 frequencies in the SAME band...the W2A can
NOT do this.
I should know...I've had one for years (and love it), but I do know it's
limitations.
P.S. they cover full 800(with 30 Khz steps available, yet)with good
performance.
the mod is just a keypad sequence.
Actually, the same mod makes the unit a pretty decient scanner(although
it IS a bit deaf around 470(but the performance is still ok there).

1438. Pro 2006 Wrong frequency

Hi,

I have an pro 2006,and today i listening to the Norwegian air force
(NATO) I think it was them but i am not sure,
The frequency was 166.4375 BUT this is Not the right frequency it
should be between 200-400 Mhz, I have tried to double the frequency,
and take it + and - 10.7 Mhz
But i can not find the right frequency.

Can anybody tell me how I can figure out what the right frequency
should be??

I'm not a techie, so I don't know what "monaural" is. I use a 1/8"
audio to 1/8 audio cord. Do you think the cord is the problem? I
don't have Sound Blaster mixer, but would the Win95 Volume Control
work to set sound? Thank you for any comments.

: >

I suspect he was refering to the situation with most of the newer
scanners that can't be truly modded, but can be "tricked" either by image
tuning, or by false-switching the front end circuitry(virtual
down-converter).

The answer:a properly reprogrammed AOR 8000 is equal to a factory 800
enabled unit-in fact in some cases better, as the bandplan is different
on the European units(this can be reprogrammed as well).
The mod gives TRUE 800 coverage.

$ Try 85-5241U03 :)
$ On re-reading the original post. What the poster was alluding to is
$ in a wide area Smart Zone (tm) system, if there are no units affiliated
$ with the site you happen to be near. You won't hear anything ...the
$ SmartZone controller won't light up any transmitters if no one is
$ around to receive. The symptoms you describe would not be observed

```
$ if the site was the only one in a remote area, with no overlap from
$ another site... ie. you wouldn't hear anything at all, no matter how
$ much you moved your radio. UNLESS, your radio could 'auto affiliate'
$ and tell the system it was in that 'zone' ...hence 'Smart Zone' :)
```

Pro-43 is a great radio...one of the best. The Pro-60 is its
modern-day replacement. Very similar, with wider frequency
coverage and Wide FM capability. Both are triple-conversion.
You'll obviously be able to monitor cell with the 43; not
so with the 60 so that will probably be your deciding factor.
The 60 does have better audio quality, is a little less
sensitive on VHF lo and a little more in the 800s. Also
has a direct tune feature that is akin to a pseudo-VFO.

The 51 is a dual conversion rig. Good seller when it's at
its sale price. Made by Uniden and equivalent to the
BC220/230XLTs.

Personally, I think the 60 is worth the extra $50 if it
comes down to deciding between it and the 51.

Good luck!

Just a word of caution to my fellow enthusiasts: I will no longer due
any business with Metrosoft after they charged my card for a product
they said was in stock and would be shipping. Turns out they had no
stock and the item had been discontinued.

I will note that they did do right by promptly creding my card after
I pointed out the error in their ways. It is in this manner that one
can appreciate companies like Grove which do not charge your card
until the item is actually shipped and are up front about telling
you if an item is out of stock, back-ordered and when a shipment
is due to arrive.

Hello Everyone:

I plan to errect an outdoor antenna for use with my Pro 2035. I have heard many good things about Belden 9913 ,except for the fact that it is not very flexible. I know that there is a fexible version of this type of coax. But I don't know how it is compared to its stiffer cousin.
What can anyone tell me about Flexi 9913.
Also what is the name of Wiremans version of Flexi 9913 & Belens 9913?
Thanks for your help.

Better yet try this Web site to confirm your NDB Beacons. It has FAA
Navaid data base. You can search by Freq or ID ! Enjoy.

Monaural is single channel output, as opposed to stereophonic
which is multiple channel output (your scanner is mono, as it has
only one speaker and one audio channel for output).

So, if you are using a stereo jack, that could be the root of your problem. Go to the near by Radio Shack and get a stereo to mono adapter jack.

If you are using a homemade cord, you may have mixed up the connectors. Make sure that you are connected neg to neg and pos to pos. If you get your polarity crossed it can result in much deminished volume.

1450. 25 Channel Cordless Freqs

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

From: root@news.gate.net
Message-ID: <slrn5g0ud7.k.root@news.gate.net>
Source record: 207966

I think there was a posting about this a few weeks ago. I went throught the McDonald's drive-thru today. Right after I got past the speaker where you order, my radio (car radio--no scanner with me) went dead. As I reached over to turn it off, I heard the McDonald's ordering and employee chatter going on! I looked at the station on my radio. 105.1, which is a popular station in this area. I know that the McDonald's I went to uses 35.02. Is 105.1 some sort of image for 35.02? I only picked up the McDonald's transmissions when I was about 10 feet from the mic transmitter, then 105.1 came back normally.

I thought for a minute that I had entered the Twilight Zone! :)

Jon,

I've seen both sides of the memory debate site NASA as a source. Do you have any specifics on NASA's information? As far as the Gates book, it is quite expensive, I'm trying to convince people here that we can save money on batteries by learning how to treat them properly.

Onto other subjects... Nickle Metal Hydride batteries. What are people's feelings on these. We have found that they are not infallable. In some cases they have met an early demise after being left on a charge for an extended period of time. I don't know how the charger works, it is an IBM ThinkPad. Does the Gates book cover these batteries as well?

I can imagine. Where I'm from, 16 channels would get 90% of the radio
traffic in the area. The response to an 'Officer needs help' call was
pretty darned impressive, considering how small the department was.

>To help you out, you can monitor us on 450.5125 MHz. We are identified as

: fix to this problem. Thanks IA.

Usually all you need to do is clean the circuit matrix. Under the keypad is a circuit board with a matrix pattern of traces. Scrub this board with a pencil eraser, then wipe down with denatured alcohol.

While you're waiting for that to dry, take a look at the underside of the keypad. Under each key should be a small button-like piece of (carbon?). Make sure they're all there & firmly attached.

Re-assemble & go! (BTW, I made am external keypad for mine with most used keys - this cuts down a *lot* of wear & tear on the keypad. E-Mail for info if you want.)

I wasn't aware of any press exemption in 47 USC 605. The only two possible "exemptions" to the law I've come across are the case of Edwards v. State Farm Ins. Co. (which, by my non-lawyer reading, said that most voice radio comms did not carry a reasonable expectation of privacy), and that cryptic "Except as provided in (whatever section)" at the beginning of 47 USC 605(a), which MIGHT indicate that communications declared "public" by the ECPA are not protected by section 605. I'm not really sure about that second one, though.

As I said, I'm not a lawyer, so I may be totally off base...But if Edwards v. State Farm really says what I think it says, then it explains why news media and pager notification groups haven't been prosecuted.

Roger that.

From the owner's manual, Page 29 -

1. Turn off the scanner.

2. Press and hold down LOCKOUT, then turn on the scanner.
OFF bEEP appears on the display.

Repeat to turn it back on.

Normally the level supplied by the speaker output is plenty to drive
the line-in jack on a sound card. I'm wondering if you're using the
wrong type of cord, (e.g., stereo patch cord) to connect a monaural
earphone jack to a stereo line-in jack. Try recording in stereo and
see if you can see a stronger signal on one of the channels.

It's probably a long-shot, but I have my scanner speaker out connected
to the line-in and it works beautifully.

Also.....I hate to be one of those "advertizers", but I have some free
software to use for PC recording if you want to try it out. It's at:

If the scanner you heard communications on 900MHz is double coversion ,
you propably heard an image of cell phones. Tripple conversion scanners
don't get the image in this range. They get them in a higher range, like
1300 MHz like my 2035.

Since the line-in is high impedance, it is less of a problem because driving a high impedance input with a low impedance source is not going to result in a weaker signal.

In fact, I have the same type of configuration, (my scanner headphone jack is connected to my sound card line-in) input and there's plenty of volume to spare without having to turn the volume up more than 1/3 of the way.

My other post on this thread points out that most sound cards use a stereo line-in connector and I think that the weak signal is because the other person is recording using one of 2 stereo channels and the signal is being delivered to the sound card on the other channel..........possibly.

Certainly a speaker output has enough momentum to drive a hi-impedance line-in coupling.

A company called Worldcom Technology sells something called the "Action Tape Controller". I took a chane and bought one and it works great. It plugs into the ear or ext speaker jack and into a tape recorder (it must have a remote plug). Thats all ! No batteries or anything. It turns the recorder on when a frequency is active and off after a short delay. It also has a external speaker jack so you can listen while you record. It cost me $31.95 shipping and all. Worldcoms number is 407-466-4640.

Frank,

I have considered this with a friend, to do an abbreviated "easy" manual, and to do an electronic manual, in ascii format so you could import it to your favorite word processor for editing. It would take alot of effort but let's see how much interest there would be. How about it gang, anyone intersted?

Happy scanning!

There are kits available to do this...Bill Cheek has a plan for it.

I am currently using an Olympus S950 (also marketed by Radio Shack as a Micro-30, 14-1062 - ON SALE THIS WEEK for $99.00). It digitally encodes the DATE/TIME on recordings more than four or five seconds in length - so you have an accurate record of not only the traffic, but WHEN it occurred!

>> >know about?

Bill...

Dallas PD radio codes are actually divided into two tables....

Signal 1 - 49 are radio call signals.... these are radio signals
which are assigned a service number as a call for service, ie, Signal
11, burglary, or signal 41-11, birglary in progress.... the
signals that are unsued are for future expansion.

Signal 50 and up are radio mark-out signals.... those which field
units "mark-out" on. Example, you will never hear an element
"mark-out" on a signal less than 50, and likewise, wont hear an
element dispatched on a signal higher than 50.

Sounds strange, I know, If an element "marks-out" on a 58 (routine
investigation" because he was flagged down by someone and it turned
out to be a burglary, the element would need to request a serice
number an dhgave a radio call sheet initiated for a signal 11. The
markout becomes a radio call with the element as the r/p or reporting
person and the person who flagged th eofficer down as the c/p or
complainant.

You will also hear Air 1 often....it is the number 1 helicopter flying
at the time. Sometimes you might hear air 2 or 3, which only means
there is more than one bird up at a time, and this happens rarely but
does happen during special events from time to time.

Also, "531" on all channels is the dispatcher. There is a long
story as to why it is 531 which I wont go into right now.

Actually, when most cell phones are digital, that will be a defacto
encryption for most scanners. What law enforcement is opposed to
is encrypting the digital coding so only the two parties on
the call can understand.

Not many planes(that I know of) are wired to access air comms through
the headset system...even if the plane you take does have headsets! If
it's a 757 or larger, your odds are more favorable.
As for operating policy of radios, that is a company policy which
varies from airline to airline with the final say ALWAYS resting with
the captain of your flight. Ask him as you're boarding if you can use
your radio/GPS whatever...most will be happy to oblige when they can.
And unless your captain has flown the particular route several times
before, it is unlikely he will be able to remember many(if any) of the
ARTCC frequencies. These are given to him by ARTCC just before they are
asked to switch to the next sector controller along their flight path...
"United 1427 heavy, contact Washington Center on 135.2"
"thirty-five two, United 1427 heavy"
etc.

I picked up a AOR ? (something, not the 8000) two years ago, and
returned it for a refund because it's images made the Local PD's freq's
useless. The refunded my cash with no more explaination than I didn't
like it due to the image problem.

I may be wrong, but not all aircraft have entertainment systems. Not all of them also have the capability to put the radio traffic on their entertainment system (to date, I've only seen United do it on a regular basis).

Also, at least on Delta, if you check the back of the in-flight magazine you'll see that scanners are allowed during the portions of the flight that other portable electronic devices are allowed.

Some crime-drama televisions shows made a few years ago are still being aired that would seem to implicate to some people on certain episodes that it is still okay to listen in on any cellular phone conversation. For example, tonight's Miami Vice on the USA channel (02/12/1997, and which title I didn't catch), made in the mid-80s, gave the impression that it was legal for the cops to listen in on a cellular conversation of a criminal without first having to obtain a warrant to do so, since it as someting in the open airwaves and could be listened to "with any police scanner." This might be where some people are getting that wrong idea from. This may have been true and correct back then; but not now since the new laws.

THis is one that has been around for a long
time....but they don't advertise much and it
is very easy to pass stores up that don't get
their ads to see

the store is: Harvey Park radio
in Littleton Colorado, near denver
phone: 303 231 6585
fax: 303 973 7661

a small operation and they deliver right away....
discount prices: right now the bc 3000xlt is at 329.95
the 2500 xtl is at: 299.95

etc.

bill conduit
that makes six sources so far uncovered on the net.
Scanner World, Ace, Harvey Park, Grove, plus two others
listed I cannot find right now....

We recently (ok a few months ago) had the great honor of havining a new In-N-Out franchise open up in the South Bay (Milpitas, Calif).

Now I don't have to drive to Tracy (47 minutes) or Gilroy (32 minutes) to have my tastebuds happy. I only drive to where 237 and 880 meet at the McCarthy Ranch.

If you've never had an In-N-Out Double-Double, you've missed out, and if you have had one, you understand.

It's funny to watch the noon business. McDonalds is across the road, with a small line of cars. In-N-Out has a line for drive-up that is wrapped out into the street and sometimes to the corner, about 80 cars or more. People park in adjacent restaurant's parking lot and come over. The "next door place" had to hire a guard to keep the parking lot "clear of In-N-Out" patrons.

So, with that unnecessary dribble :-)

Anyone know the freqs of In-N-Out? One nice thing they provide when the lines are long, is a person taking the orders. He/She walks through the cars in drive through, takes the orders, radios them in, than chats for a couple of seconds before going on to the next car. Nice touch.

If you haven't already, please try them out, and get me the freqs while you're at it. You won't be disappointed.

I have a UBC 9000 XLT, works fast and good, nice DOT-display with 16
characters for naming the recieved stations.
Use it also to receive NOAA weather-pictures on 137 Mhz and get the
compleet pictures. (a friend of me have a real NOAA receiver and the
pictures are the same)

Don't know much about the 2042 buth for me the 9000 XLT is VERY good !

Good luck

William

Can you buy scanners which you can use to listen to conversations on digital (not spread spectrum) 900 Mhz cordless phones? If so, are such scanners common? I'm just trying to determine how secure my conversations are on my 900 Mhz 10 channel digital phone.

In article <5drkbf$98e@acmey.gatech.edu>,
William C. Thompson <wt2@prism.gatech.edu> wrote:

>Hi, I have had a idea concerning converting the Fisher Price
>Units over to a small, cheap repeater.....

I posted this a few years back:

CONVERTING THE FISHER-PRICE BABY MONITOR INTO A REPEATER

Bob Parnass, AJ9S

The Fisher-Price baby monitor (model 157) consists of an AC operated, low power FM transmitter, and a battery operated receiver. Both transmitter and receiver are equipped with 2 crystal controlled channels in the 49 MHz range. The unit modified for this article was equipped with 49.845 and 49.875 MHz channels, designated 'C' and 'D' respectively.

This modification allows a hobbyist to connect the baby monitor transmitter to the TAPE jack of a scanner or shortwave receiver and rebroadcast the transmissions in the 49 MHz range. One can roam around the house or yard with the portable baby monitor receiver, a portable scanner tuned in the 49 MHz range, or even a 2 meter walkie talkie tuned to the 3rd harmonic, listening to transmissions intercepted by a base receiver.

No changes are needed in the baby monitor receiver, although one could disconnect the red light emitting diode (LED) to prolong battery life. In the transmitter, we will be disconnecting the microphone and installing a 1/8" phone jack and DC blocking capacitor.

Parts needed for the modification:

- 1/8" miniature phone jack

- A capacitor with rating of 25 volts or higher. Use of the baby monitor with most receivers requires a 0.001 microfarad capacitor, e.g., a Radio Shack PRO-2004, PRO-2005, PRO-2006, Icom R-7000, R71A, or NRD-525 receiver. Older Bearcat scanners, like the Electra Bearcat BC300, BC220,

BC20/20, or BC250 scanner will require you use a 0.1 microfarad capacitor instead.

- insulated hookup wire

- solder

- heat shrink tubing or electrical tape

To modify the Fisher-Price transmitter:

1. Make sure the transmitter is disconnected from the AC line.

- 2 -

2. Turn the transmitter upside down and use your fingernail or a small screwdriver to remove the rubber feet, fastened with rubber cement. You should now see 4 Phillips screws holding the top and bottom of the plastic cabinet together. Remove the 4 screws and save them for reassembly.

3. The rubberized antenna and microphone are connected, using crimp on connectors, to pins on the printed circuit board (PCB). Using a needle nose pliers, temporarily disconnect the white wire that connects the antenna to the PCB.

4. Using a needle nose pliers, disconnect the 2 conductors of the shielded cable that connect the microphone to the PCB. Tape the ends of the shielded wire and stuff them back into the cabinet top. The microphone is disconnected to prevent the transmitter from repeating room noises. If you don't disable the microphone, you will be "bugging" your own house!

5. Remove the cabinet top and drill a 1/4" hole in the side of the cabinet top.

6. Mount a 1/8" miniature phone jack in the hole. Don't overtighten the nut or else the plastic case might crack.

Note: although most phone jacks have 3 solder terminals, we will be using only 2 of the 3 terminals.

7. Solder the end of a piece of insulated hookup wire to the sleeve terminal of the jack.

8. Solder the other end to the pin on the PCB where the microphone shield had been connected.

9. The original circuit placed a DC voltage across the microphone. We must add a blocking capacitor to prevent any DC from flowing between the transmitter and the scanner or shortwave receiver. Solder one end of the capacitor to the tip terminal of the jack.

10. Solder the other end of the capacitor to a short length of insulated hookup wire.

11. Slip a length of heat shrink tubing over the capacitor. If you have no tubing, you can use

electrical tape instead. Solder the other end of the wire to the pin on the PCB where the micro-phone center conductor had been connected.

12. Reconnect antenna to the PCB.

13. Using the 4 Phillips screws from an earlier step, reassemble the cabinet top and bottom pieces.

14. Replace the rubber feet. That completes the modification.

Use a shielded patch cord to connect the Fisher-Price transmitter to the TAPE jack of your scanner or shortwave receiver. If your receiver has no TAPE jack, try connecting the transmitter to the earphone jack.

As a last resort, you could use the external speaker jack. If audio from the speaker jack overloads the baby monitor transmitter, producing distortion, use an attenuating patch cable to reduce the audio signal level.

The same modification has been applied to the PlayS-chool baby monitor, which is housed in a different style plastic case.

If your neighbors have scanners, cordless phones, or baby monitors, they can probably listen in to your scanner, too!

>

It does look like a nice unit, except that it only scans at
6 channels per second, which is way too slow. It's a shame
that a radio that seems to be pretty nice otherwise has such
a fatal flaw.

I just bought an AR-8000, and so far am quite pleased with it.
Once my Optolinx interface arrives, I will really be set.

I also have a Pro-2035/OS535 that I like a lot as a base scanner.
The Pro-2035 has a few serious shortcomings as a standalone
scanner, but with the OS535 interface it makes a very nice
unit as long as it is connected to a computer.

I purchased some video equipment from them a couple of years ago, and
was satisfied then. Just be advised, those NY/NJ electronic outfits
change owners like I change my socks. (Daily) For the most part, I WILL
NOT buy from 99% of the NY/NJ outfits due to their unscrupulose ways.
(Pardon the spelling). I just don't trust them after many bad
encounters.

Bob,
The Pro-51 is way overpriced at the typical selling price of
$300. So this offer is probably a "fair" deal from their end if
that is indeed what they purchased it for.
It is currently on sale for $200 at Radio Shack.

Strong signals,

I would start with USN HICOM on HF (11Mhz/6Mhz as I recall). They will of course be active in DoD Aero (225-400Mhz AM) as well as FLTSATCOM (now UFO) downlinks (listed in MT this month). There should be activity on marine VHF whenever they are close to shore. Most of the comms in and out of the CVN will vary in frequency. Most USN comms either UHF or SHF satellite now.

I'm trying to get the frequency of my local police department without much luck. When I call them on the phone they will not give it up. I've tried many local publications with no luck. I've even tried the local fire department, and they don't even know it.

Is there some place I can go to find this out? HELP!

Please E-mail me directly at chris@greenrock.acadia.net

Thanks

There have been numerous posts on this newsgroup over the last 2-3 weeks containing exactly that. Try reading previous articles first; if they are no longer on your server look on an archive site like www.dejanews.com

In short: the receiver section and construction quality are good. The operating firmware suffers from a terminal case of "Icom *STILL* doesn't get it" syndrome.

No, the European bearcat UBC3000xlt has no blocked frequencies. Only the
part from 550 to 700 is not working. Cellular and cordless telephones
can great received (it's legal in the Netherlands;-))).

I haven't heard that it isn't sold anymore.

CYA!

I just got the new Sony SPP-ID910 cordless with caller ID. it's a 900Mhz digital. I have heard some negative things about this phone but I decided to try it anyway. I LOVE IT! So far sound quality is great. Again I heard comments about annoying side tones and such but I hear NOTHING other that what is normal. ALL phones are SUPPOSED to have a side tone. Without it would be strange? Range and battery life seem great so far as well. I think it a real keeper. Unless your evidently a REAL FANATICAL type person, I thing the average person would be more than happy with this new Sony.

I would have to say that from my experience Scanner World seems to have good and bad days customer service wise. Of course I pass their establishment every day on the way to work so whenever I have purchased something from them, they've had to deal with me face-to-face. A lot harder to dismiss someone's complaint when they are standing in front of you as opposed to talking to you on the phone.

Have you considered that people with a lot of radio knowledge probably
don't choose to work in retail making 15K a year? These are
salespeople, not technicians for Christ sake. Would you expect to go
into a shoe store and find a salesman who is well versed in shoe
making or fashion? You <may> find one, but they are few and far
between. If you have the brains to ask the question, have the brains
to find out the answer for yourself.

No, same nasty sidetone as always. Basically it's the same phone as their older
models with increased transmit power on the base and handset.

>I own a Toshiba FTH955 which is almost certainly the same as a VTech 900
>NDX. 10 channel digital 900 Mhz. Range is about 500 ft or so. Good
>sound quality. No detectible sidetone. I tried an Escort 9100. Only
>advantage was better range (600-700 ft). Sound quality was good other
>than the terrible sidetone. Poor ergonomic design, IMO.

Actually, the VTech phones have quite nasty sidetone as well. Some over time
must not be sensitive to it as I see owners of them say there is "no sidetone"
problem with them. They get quite upset when I tell them what to listen for
and then they hear it. ;-)

If you want a good quality computer controlled scanner, I think that the AOR3000 is one of the best. I dream of someday owning an AR5000, but I have been quite happy with the 3000. If you have not used a computer controled scanner, once you use it once, you won't want to go back to the 'old way'.

Keep in mind, it is still a radio broadcasting on the 'public' airways.
While it might be 'illegal' to monitor these and certainly will be so
soon if congress gets their, it is in no way a ï¿½secureï¿½ method of
communication. Just making something 'illegal' does not mean that it
wonï¿½t be done. We still have murders, and that has been illegal for a
long time, and that usually leaves evidence, the body. Evesdropping
leaves no trace, unless you are stupid enough to record it and give it
to your congressman.

So, the bottom line, donï¿½t say anything that you would not say in front
of a room full of strangers.

>
> Thanks.
>
> ckemp@chat.carleton.ca

The 7100 is a great radio. But it is in a slightly different class than the 3000. The extra money for the 7100 goes for a more sensitive receiver and the 500kHz - 25MHz coverage. The 7100 has 1000 channels but only ten banks which makes any kind of management kind of a pain(100 channels/bank). The Uniden is much better with 20 banks with 20 channels each. Both units have great audio(loud and clear) but I personally prefer the 7100...more natural sounding with better mid-range tone.

The 7100 has ten search limits to the 3000's one. The 7100 has 500 search lockout frequencies compared to the 3000's 50. The 7100 is restrictive in that you can only scan, 1, 2, 3, 4 or all banks at any one time...this may or may not be a concern to you. The 7100 uses 4 AAs compared to the 3000's ni-cad. The 3000 has auto-store while the 7100 does not. Both have a battery saver option...the 7100 has three selectable settings. The 7100 has one priority channel to the 3000's ten. The 7100 has a VFO, the 3000 does not. Both have selectable per-channel attenuation. Both have display lights but the 7100 also illuminates the keypad. The 7100 has ten frequency steps to select from; the 3000 has four.

If you want great sensitivity, AA flexibility and ability to dabble a little in HF, go with the 7100. For all the latest features in a solid VHF/UHF/800 performer, go with the 3000.

You might also want to check out the MVT-7200 which is the 7100 with a few HF features enhancements.

If you can afford a "little" more, you might want to check out the new MVT-9000. VERY similar to the 7100/7200 but has bandscope, twin VFOs, auto-store, 1000 channels, twenty banks, twenty search limits and alpha-tagging.

Good luck!

Sure,
I heard it on 169.750 Mhz, with my UBC3000. I heard it in the Netherlands (I live there), it's a very strong signal, probably not local, because it's strong everywhere in ther neighbourhood.

I think it's some kind of (weather-)fax, because the "tik" every 1/2 sec.

This is about everything I know...

How to Use the FTP Server at ATTENTION to Details BBS
-----------------------------------------------------
The ATD BBS FTP Service is offered as a cost-effective means to obtain
information and files from our Bulletin Board System (BBS) - using
Internet E-Mail as the method of exchange. Using our FTP Server is as
simple as addressing an Internet E-mail message to

ftp@atdbbs.com

containing one or more KeyWords. Multiple KeyWords can be combined in
a single Message - but it is very important that there be only ONE
KEYWORD PER LINE!

EXAMPLE: You see from the above list of KeyWords that you want a copy
of our textfile on NiCad batteries and our Help file. Address your
Internet E-Mail...

TO: ftp@atdbbs.com
SUBJECT: [anything here is OK]

...and write the corresponding KeyWord, NICADS, as the ONLY word in the
FIRST LINE of your message. And write HELP on the SECOND LINE of your
message. That's all there is to it!
```

>ICOM R10

I don't know the R10, but I have an R1 (full cell model) and find the features to be fantastic, but the front end sensitivity is a bit too high with the selectivity of the unit i.e. in my area (NY metro) there are many very high power signals on VHF/UHF band, and there is almost always an overload problem with my receiver, adjacent channels will almost always stop the scan even with the squelch completely closed using a 6" rubber whip antenna. The R-100 seems to be the same circuitry with a few significant added bells. My friend owns one and has the same problems with his. If you monitor one channel at a time, or manually cycle through the bands these radios are very sensitive and receive well, however, I cannot recommend them for scanning at all. I wish I had purchased a 7100, I would have been much happier.

This scanner is easily cellular modifiable. It can also be easily modifed
to save an extra 100 channels on top of the 300.
I am selling this classic scanner for $290 US plus shipping and handling.
Comes in original box with styrofoam packing. Works perfectly. Comes with a
telescopic antenna Email me for more information

PRO-2004

Operating Modes
AM/
Narrow Band FM/
Wide Band FM/
Programmable
Scans in steps of 5k, 12.5k, 50kHz
Has 10 monitor/search channels independent of the 300 channel memory
Standard or Sound Squelch
LCD display with Hi/Low backlighting
Individual channel lockout
2-second scan delay, selectable with each channel
Selectable priority can be set to any channel
Search circuit lets you find new frequencies

First, let me compliment you on your choice!

Second, I tried and got rid of ScanStar, and ScanManager (?). I'm running Probe v2, and love it. The only problem and it's actually one of it's strengths, is that it is a DOS program. It does, however, run magnificently in Win95 on my system. But, it will run fine on a 286 with 640k almost as well. The more computer you have, the higher the scanning speed (to an extent). I've found the author to be *very* receptive to suggestions and questions, unlike the tech support for other packages. If you want any more details, drop me a note!

Sincerely,
Robert McIntyre

Here-here!

Curious, though...

You forgot to mention the efforts of the ARRL to fight the new law. Oh...
Wait. That's right. I forgot. In 2003, the ARRL disappeared due to lack
of membership funding, apparently as a direct result of businesses
surepetitiously purchasing all of the amateur radio bands out from under
the hams. :(
You also forgot to mention how they planned to reimburse the scanner users
of thier equipment once turned in, which in some cases might amount to
thousands.

1558. Dispatchers Request

Newsgroup: rec.radio.scanner
Date: 1997-02-12 00:00:00 UTC
From: Bill Doss <Mail@Not.Really.Me>
Message-ID: <330294BB.2898@Not.Really.Me>
Source record: 207785

Hello,

I hope not to offend anyone here, and my message isn't really directed to those in this group, but more in hope that you will pass it on to others. I am a communications dispatcher, we do Police/Fire/EMS for an Ohio County. I think that fully 20% of homes in the area have a scanner in them (no one turns them down when they call 911).
Many of the dedicated scanner monitors know our frequencies and codes as well or beter than we do. A problem comes up when we make the occasional (daily) mistake and say the wrong engine company number (some have the tones down to the point that they can tell which engine I am calling by the tone sound-we have about 60 different tones!!).
While I respect the desire that scanner buffs have for monitoring, I really have my hands full when I am on the job. Very often I do not have time to answer the phone 5-6 times when this occurs and explain what happened...I had 2 scanner buffs call in (one on 911) to tell me that I said engine 1-11 when I toned 2-11 today. Another example:
People that call in to ask details on calls. If the call really is "intense", I am probably as busy as can get with alarms and stuff...
Thanks for allowing me to vent...

Good signals!!

Bill Doss
asystole@cinci.infi.net

1559. A "Call To Arms" to all scanner users?

Newsgroup: rec.radio.scanner

The following exceprt of words appeared in an advertisement in the Gainesville Sun, bottom of page 7A, Feb. 08, 1997.

"YOUR CELLULAR PRIVACY IS _OUR_ CONCERN.

ALLTEL Mobile and the CTIA (Cellular Telephone Industry Association) are totally commited to ensuring complete privacy for all cellular phone users. Together we are doing everything in our power to minimize the risk of eavesdropping on cellular telephone transmissions, and to toughen existing laws governing this offense. Intercepting cellular phone conversations is currently a violation of Federal and state law and we believe that anyone guilty of this crime should be prosecuted to the fullest extent of the law. To aid us in making this crime less likely, and the punishment more severe, we urge all cellular phone users to write their congressional representative and express concerns about this important issue."

I'd like everyone to note the words "totally committed to ensuring complete privacy" and "we are doing everything in our power to minimize the risk of eavesdropping".

As I see it, there is only ONE WAY to make good on this apparent "promise" to their customers...to make all scanning illegal period, and to remove all scanners from public hands. UNLESS, of course, they're planning on recalling all analog cellulars and replacing them with digitals at no cost to the customer. Plausible? ....NAHHHH!

Should we be worried right now what these guys are really going to be up to next very soon in Congress? What exactly do they plan to do to make good on their promise? How do they expect to make good on their promise? by written means? or by stomping out scanner "competition" altogether?

I had a IC-W2A (was stolen a while back) It was capable of monitoring
UHF and VHF simultaniously (both sides). But it was NOT capable of
monitoring TWO UHF or TWO VHF freqs simultaniously.

A friend of mine has a Kenwood TM-732 that has dual "inband" receive -
you can put TWO UHF or TWO VHF freqs up in the display and listen to
both at once. But it is not capable of inband full duplex operation.

I want to buy a Yaesu FRG-9600. Must be in real good shape both cosmetically and perfect electronically. Must be reasonably priced; I want one, but I am not desperate. It does not have to have the video adapter. Must also have the manual.

Thanks,

David, WA7ZYQ

I field tested a set of these for a couple of days in an industrial
invironment a few years ago. They do work but are not very convienent
to work with especially if you frequently go from the noisy
environment to an office environment. I found it easier and just as
effective to use the little foam cylinder earplugs and if you need to
talk to someone you yell a little. The big advantage to the foam ear
plugs is you can grab a hand full of them and stick them in in your
pocket or tape a few pairs inside your hardhat or whatever and they
are always available.

From: Bruce <cpsd@ix.netcom.com>
Message-ID: <5dr2vt$8v8@dfw-ixnews7.ix.netcom.com>
Source record: 207834

Greetings,
I live exactly 100 miles from New York City. I would
like to pick up NYPD frequencies on my scanner on the
470-476 mhz band they use. Would a multi element yagi
for the uhf band along with a in-line coaxial amp. and
heavy duty coax do the job? Or is 100 miles just tooo far?
Right now, I only pick them up on my regular outside
antenna certain times of the year when the conditions are
right, mostly during the summer.
Thanks,
Bruce

I am selling this classic scanner for $290 US plus shipping and handling. Comes in original box with styrofoam packing. Works perfectly. Comes with a telescopic antenna Email me for more information

PRO-2004

Operating Modes
AM/
Narrow Band FM/
Wide Band FM/
Programmable
Scans in steps of 5k, 12.5k, 50kHz
Has 10 monitor/search channels independent of the 300 channel memory
Standard or Sound Squelch
LCD display with Hi/Low backlighting
Individual channel lockout
2-second scan delay, selectable with each channel
Selectable priority can be set to any channel
Search circuit lets you find new frequencies

Our volunteer first aid squad has recently switched to dispatching on a different frequency and, as a result, has a number of receivers that we would like to sell.

All of the units are set for 33.04 MHz, and are activated by toning out 2164 & 1985 Hz. Manuals are available for the Plectron brand units.

Available are:
2 - Plectron R719B2
14 - Plectron R8190B1
9 - Shinwa SR36VT
16 - Shinwa SR38VT

The Shinwa units are small enough to clip to your belt, and drop into a charger; the Plectron units are the size of medium-sized book, but are designed to be carried by the built-in handle or for use as a base receiver.

Also available are 8 other units for which we do not have the exact model available (we need to get them back from members to whom they were issued) and about a dozen tube-based Plectron units which are still serviceable.

For more information, e-mail <sfas@spfld.com>.

Does anyone have any comments about the Yupiteru MVT-7100 scanner? It has some nice features, and since it is only about $50 more than the bc3000xlt, I was wondering if it is worth considering.

Thanks.

ckemp@chat.carleton.ca

1585. Radio Spectrum & Las Vegas Frequency Guide

Newsgroup: rec.radio.scanner

I placed in my web pages on CompuServe a guide to the radio
spectrum, plus a listing of certain Nevada radio frequencies,
which includes stuff like casino frequencies.
I can't verify the accuracy of all of this, and some of it
might be a couple of years old. But it is still useful.
Go to:
http://ourworld.compuserve.com/homepages/berton_corson
and pick "A useful guide if you own a frequency scanner."
The radio spectrum is on top, and the Nevada guide is the
second half of this file/page. It's all in plain ascii text
so it can easily be saved to disk or printed.
Enjoy

I am selling this classic scanner for $290 (US) plus shipping and handling. Comes in original box with styrofoam packing. Works perfectly. Comes with a telescopic antenna Email me for more information

PRO-2004

Operating Modes
AM/
Narrow Band FM/
Wide Band FM/
Programmable
Scans in steps of 5k, 12.5k, 50kHz
Has 10 monitor/search channels independent of the 300 channel memory
Standard or Sound Squelch
LCD display with Hi/Low backlighting
Individual channel lockout
2-second scan delay, selectable with each channel
Selectable priority can be set to any channel
Search circuit lets you find new frequencies

But, it doesn't seem to cause DELTA AIRLINES a problem, because
they explicitly *allow* the use of scanners on their flights, except
during take-off and landings.

SUPPORT DELTA AIRLINES. THEY SUPPORT SCANNER USERS!

The fascist state is NORTH Korea, and being such would not even
consider giving an average citizen Internet/USENET access.

South Korean was our ally during the Korean War, and is at least
nominally a democratic republic.

It sounds like he might be hearing the data channel of
a trunked system. If so, just "lock out" that frequency on the scanner
and scan the other trunking frequencies.

Let me start out by saying that I don't claim to know more about ni-cads than the engineer that developed them, or for that matter anyone else, and I\m not trying to do any name calling or discredit anyone. Let me add that, in my mind, the jury is still out as to whether memory effect is myth or reality. From my own experience I tend to believe it to be fact, but I'm trying to keep an open mind.

Jon Van Allen <yonnie@worldnet.att.net> wrote:

<snip>

>
>The bottom line is, "memory effect" was dubbed in error.

Several years ago, 10-12 maybe longer, I read a very detailed article about the battery system in a recently launched satellite. The author went into great detail. He indicated that there were two banks of ni-cad batteries, while one was being used the other was being cycled or conditioned I don't remember which term was used. He described this conditioning cycle as a controlled discharge/charge cycle that would ensure that each battery bank would occasionally be subject to a complete, within safe limits, discharge. He went on to say that without this occasional deep discharge that the satellite could fail prematurely due the "memory effect" of ni-cad batteries. I don't believe that he actually used the term "memory effect" but he did describe the phenomena currently described as "memory effect".

I can't believe that the engineers that designed this spacecraft would add the extra weight of an additional bank of batteries and the additional control circuitry for a myth.

This has been several years ago though, it may be possible that older ni-cads demonstrated memory effect while current formulations do not.

Another instance that comes to mind is from 5-6 years ago. I maintained several laptop and desktop computers at my place of employment. We had just received 6 new laptops with ni-cad batteries that went to the 6 most needy users, no I wasn't one of them. We seemed to have two distinct types of users, one that seldom used the

laptop on battery power, I'll call them "lobat", and one that usually used the laptop on battery, I'll call them "hibat".

Four of the users seemed to fall into the lobat group and the other two into the hibat group. The lobat users would generally only use the battery power when they were in a meeting or AC power was unavailable. A typical lobat battery session was only 1-2 hours and then it was back to AC power, which also charged the batteries. The two hibat users would generally only connect their laptop to AC when the received a low battery indication. This was typically 4-6 hours and could be a little longer if it was several shorter sessions as opposed to one or two longer sessions of battery use.

After about 9 months the lobat users started to complain that they needed new batteries. It seemed their laptop would only run for 1.5-2 hours with a fresh charge on the batteries. By 12 months all of the batteries had been replaced in the lobat group. No attempt was made to rejuvenate any of these battery packs. The hibat users were still going strong on their first battery at three years when I left the company and most of the lobat users had already had their batteries replaced a second time.

I would guess that the folks here that believe in memory effect would attribute these early battery failures to memory effect while those that claim memory effect is myth would claim that the battery charger in these laptops was poorly designed.

Which is correct? I really don't know, you can make up your own mind.

The most recent instance I wanted to mention was only 4 months ago. It involves the 7.2V 600mah battery pack on my dual band hand held transceiver. This pack is about two years old. I do use a rapid charger and always remove the battery from the charger when the indicator on the charger indicates the battery is charged. The charger is the charger recommended by the battery manufacturer.

For the first 12-14 months that I had this pack I was always very careful not to recharge the pack until I had indications that it needed charging. During this time I always had excellent battery life.

But then I started getting lazy and I'd drop the battery in the charger after much lighter use. After 6-8 months of this I noticed that the capacity of the pack seemed to be decreasing.

I set up a simple test jig using a resistive load a milliamp meter and a voltmeter. After charging this pack I then hooked it to my test jig and discharged it to 6.0 volts. I just used a resistive load so the current decreased as the voltage decreased but averaging the current it looked like my 600 mah pack was only giving me about 380 mah.

I then put the pack through five successive charge/discharge cycles in my test jig. To my surprise the capacity of the pack increased with

each cycle, at least for the first 4 cycles. After the 4th cycle the pack checked at 575 mah. After the 5th cycle it also checked about 575 mah.

Since then I've been careful not to charge it unless I think it's mostly discharged and the capacity seems to be staying right up there where it was before I got lazy.

Now I would be hesitant to call this memory effect because the engineers that developed ni-cads and the companies that make them say it's only a myth. But I will say that I have used many ni-cads over the years and that it always seems that the harder I use them the better they perform and those that I give very light use seem to die a premature death.

Your experience may vary.

Hi, I have had a idea concerning converting the Fisher Price Units over to a small, cheap repeater. I would be great for hamfests and such. As it would have no ID, you would have to ID for it. It should not be to hard to re-xtal the units over to 6 meter. The low power would not be a problem in this application, really a plus. Any comments?

>band? any coments will be helpful thanks !!

I think it's important to ask yourself which features you are most likely to need and use. I looked at the Pro-2042 because many people said it had the better receiver, less prone to intermod & images. Yet, for all of the reasons I could have picked to buy the 2042, I bought the 9000 for two reasons: CTCSS decoder board option and Alpha-Numeric display. There's no way I can remember all the frequencies and what they go to, the alpha tags eliminate that problem.

Now you can do the same thing and much more with the 2042/Opto combo, but only with a computer. As much as I scan mobile and while camping (like a good portion of the summer season) I needed these capabilities on the go, so I chose the 9000 with CTCSS board. I couldn't be happier, this is a serious scanner.

The ONLY gripe I have with the 9000 is it gets cellular images in the 360-400 Mhz range (or thereabouts). I listen to military aircraft in this band, so I use my Pro-2004 and AR-8000 for the mil aero band instead.

There are pros and cons to both radios, just chose the features you want and make the decision. I don't think you'll be sorry with either one.

Happy scanning!

Jon

Godd observation Rick.

Hey, did you know "Rick" rhymes with "Dick"?? and "Prick"??

That's cool. You see Ricky, if I get a dickhead post.. I might respond with
same.. just for fun, otherwise not. Kinda like the adove, see how that
works..Rick

I was watching the chase with a satellite dish, a live feed from some
station's copter - KTLA maybe...

I heard the cell phone call live during the chase, I didn't hear anything like
"I did it".

I'm not sure if the cell phone was intercepted by the reporters or the cops -
it's been a long time..

hey..here in the Phoenix area (Mesa) today, an autistic boy climbed a 120 ft tall power tower. his 17 year old brother went up after him to try to comfort hum and hopefully get him down. ...the fire equipment brought to the scene (ladders, boom trucks) could only reach half-way up the tower.. a utility company bucket truck was brought to the scene. The utility companies equipment easily reached the top of the 120 ft tall structure and rescued the boys..the crew went back a second time to get the firefighters down who had climbed the tower from below.

these type of towers, it was reported carried about 200,000 volts...enough for a small town...these towers are used for transmission of electrity between generating stations and regional substations or switching centers.

this rescue was caried live by all the local news stations...each with both their helicopter and ground crews on the scene.

the autistic child, it was reported climbed the tower with only socks on his feet.

Everyone had plenty of praise for all the people at the power company (Salt River Project) who worked behind the scenes to cut power to these lines, and also to get their crew and equipment to the scene so quickly

the TV newsmakes it look like it was just a few who participated but there were many more who's names won't be published in the papers...they were just doing their job....and doing it well.

I have been scanning the PS bands for 20 years. I have never called 911, never showed up at the fire, crime scene or 7 car pile-up. I have called the non-emergency number 2 or 3 times (I think the guy with the shaved head and AC/DC T-shirt is hiding behind my house). The main reason I don't get "involved" is because I don't want to be "known" to the police, fire, EMT's as the guy with the scanner. I have a few friends in Public Safety and they tell me that once you get the "Guy with the scanner" label, you may attract traffic tickets, stops for ID and so on. I enjoy my hobby, but its just that a HOBBY! I am not a junior patrolman or fireman.

While that is true, it doesn't touch on the question.
The answer is: No, there are no scanners available that will allow
someone
to listen to your conversation on a digital cordless phone.
The voice signal is converted to a digital signal, and scanners don't
have
the capability of converting that digital signal back to analog voice
signals.
Yet.

All it takes is one person in a conversation to give permission to legally record or release the recorded conversation (when recorded by a third party), as far as I know. I would imagine that perhaps it hadn't been released before because there may have been a court order against it until the trial was over, I don't know. Who gives a fuck? Haven't you guys ever heard a recorded 911 call before?? If you remember, Nicole's 911 calls were released at the very beginning of this whole circus.

1619. About Motorola trunked radio channel information

Newsgroup: rec.radio.scanner

Message-ID: <33037EC9.1BD1@library.gatech.edu>
Source record: 207625

--

To anyone who might be interested in the information on Motorola trunked radio system control channel signalling that was posted a few days ago:

The author of that file did a reasonable job but then fumbled at the end zone. He will find things work better if he were to use the right formula for calculating frequency assignments. He will then also no longer have problems with what he calls bogus 'frequencies'. Apparently he did not realize his scanner was jumping to the wrong frequencies because of a mistake in his formula. The correct formulas (at least here in the United States) are:

800 MHz Systems with 25KHz channel spacing:

Frequency in MHz = 851.0125 + 0.025 * command

900 MHz systems with 12.5KHz channel spacing:

Frequency in MHz = 935.0125 + 0.0125 * command

Systems in other frequency bands should have similarly simple formulas.

Other than that, it looks like the rest of the information is correct.

By the way, I hope everyone will forgive my desire to remain annonymous.

Make sure that you use an attenuating patch cable. This has a built in resistor to lower the signal strength, Radio Shack or similar places have them. I have found that in most cases the output level of the scanner is higher than what the mike jack of the recorder is expecting. To get a decent recording, you end up turning the volume down so low that the threshold of actually getting a signal, no signal at all and overloading are almost the same. With this cable you have a much wider range for the volume control.

That's true I didn't, I would post more scientific information if I
had any. I wish I would have had the luxury of digging into the
problem further. But at the time my job was keeping the computers
running not determining what went wrong with the battery pack just
that the battery was the problem and replacing it.

>

This pack is still sealed, I had half heartedly tried to open it but
it looked I was going to completely destroy it before it came apart.
So I gave up before it was in several small pieces and I wasn't able
to measure each cell.

But you do make a very good point, Jake. I have never found a ni-cad
pack where all of the cells were exactly matched. There are always
some cells that will either self-discharge quicker or have slightly
lower capacity. And usually the cells that self-discharge quicker are
the ones with lower capacity. Probably because it has grown more
"wiskers" internally.

With my normal usage this battery would normally last 3-7 days. When I
started getting lazy and putting it in the charger before it was
discharged I was also using it less. I was still probably charging
the battery pack every 7-10 days. With less usage I would expect that
the cells with a higher self-discharge rate would be lower than the
other cells in the pack and that the difference between the individual
cells would be greater than if the pack had seen higher usage.

Now couple that with the fact my charger, like many, is of the variety
that detects the slight voltage drop when the pack reaches a full
charge. I'd never really thought about it before but what happens
with this type of charger when the cells in a pack aren't at the same
level of discharge? As each cell reaches a full charge it's voltage
will drop slightly but other cells in the pack aren't fully charged
yet and the voltage across them is still increasing. I would expect
the total voltage of the pack would take a slight drop once most of

the cells reached a full charge and trigger the charger to drop into trickle mode. But are all the cells fully charged at this point? I had actually probably been aggravating the situation by removing the pack from the charger as soon as the charger dropped out of fast charge. If I would have left the pack in the charger overnight it might have "topped off" the weaker cells in trickle mode.

Lets assume that one cell in my pack has a higher self-discharge rate and that the others are all perfectly matched. Lets also assume that all of the cells are charged to 100 percent of capacity. After one week of very light usage lets also assume that the cell with the higher self-discharge rate is at 50 percent of capacity while the others are at 80 percent of capacity. Now I drop the pack in the charger. I would expect that the charger would drop out of fast charge mode when the 5 perfectly matched cells reach full charge. At that point I remove the battery from the charger. The cell that was at 50 percent could not possibly be fully charged. Lets assume it made it to 85 percent. Now lets repeat the same cycle except this time the weaker cell is at 85 percent when we start and the other cells are all at 100 percent. Even if the weaker cell was much closer to the other cells in the pack than my assumptions it wouldn't take too many cycles like this before its charge would be much weaker than the other cells in the pack.

My test jig discharged the battery in 30-45 minutes so there wasn't any time for the cells to self-discharge. Since I took the pack down to 6 volts (one volt per cell) even the stronger cells would have been almost completely discharged allowing the weaker cells to get a more complete charge before the charger kicked into trickle mode. So what I may have actually been doing when I took the pack through the 5 charge/discharge cycles is simply assuring that even the weakest cells in the pack were also fully charged.
>
>Jake Brodsky, AB3A mailto:frussle@erols.com
>"Beware of the massive impossible!"

Well Jake, I think you may have done it now. I think you've convinced me that at the cell level there is no such thing as memory effect in ni-cads. The effect that we see and commonly refer to as "ni-cad memory effect" can be easily explained by imperfectly matched cells in a pack compounded by improper charging technique.

Thank you,
John

Message-ID: <19970213222200.RAA09314@ladder01.news.aol.com>
Source record: 207632

Bill,

I also understand the concerns that can arise when the public and the media
are calling you, especially if they are using 911, while you are conducting emer-
gency communications.

Here in NC, we still have some counties where, on the graveyard shift, the dis-
patcher is responsible for telecommunications, dispatching law enforcement /
fire / ems, and regular checks of the jail cells. I remember an incident where
a dispatcher fell and was hurt running across the buidling from the jail facilities,
trying to answer a call on the 911 line (Jones County in eastern NC).

Here's a couple of suggestions that might help your situation:
- If you have enhanced 911, call them back after the shift. Ask them to call
in on your non-emergency phone line in the future, but thank them for their
help.
- If someone's trying to be helpful, maybe you could have them come down
to the dispatch facilities at a "convenient" time for a tour. A tour can help
them understand just how hectic your job can be when the tones sound.

I've found that a little bit of encouragement and understanding can go a long way.
The fact that people are calling means that they are listening, and might one day
make the difference. If I remember correctly, there was a car dealership fire in
the Jersey City, NJ area about three years ago ... several firefighters lost their
lives when they became trapped in a back room area. Firefighters outside the
building didn't hear them on the fireground channel, although some area monitors
did hear their calls for help and called the department. Unfortunately, the other

firefighters couldn't get to the trapped men in time.

Hopefully, you and your agencies can find a way to smooth the rough edges on
some of your listeners, and turn them into an asset for the agencies.

Good luck, and always feel free to vent your concerns with the newsgroup!

Jeff Multer, Charlotte, NC

You've been taught wrong. Read the threads here, do the research, and
make up your own mind. There is a "memory effect" but it's nearly
impossible to duplicate, even in the lab, and is not a factor in
consumer use.

As Bob Parnass and others have written, the "look-ahead"
feature(termed SIGNAV) while scanning seems to provide no
benefit. I can see how this is the case since it can only
"look" for frequencies within +/- 100kHz of the frequency
being listened to(stated in their ad). I doubt there will
be many cases where the scanned frequencies are programmed
such that this feature is beneficial...which means you're
left with 6 channels/sec scan speed.

One way to fight that sort of thing, boycott their services, Don't use
their cell phones or pager services. That will hit the stupid buggers in
the pocketbook. If we do it all over the U.S. and let the local dealers
that are going to loose their shirts in business know why we are going to

stop using cell and pagers, well, you get the idea. How long will they put up with the lose of their income because of some policy that is senseless and because of something that could be cured with technology instead of law after law after law.

Fred

I may not always agree with what you say. But I will defend to the death your right to say it.

>>Oh, and by the way, dude, there is no "memory effect" in nicad
>>batteries, so including that in your advertisement is misleading.

It is a BFD to plenty of folks. There are lots of cheap things that
will work in any application, and always one or two high quality items
that work better. This is one of those better quality things. I do not
mean to make anyone think that they can't use a Taiwanese piece of
junk, rigged up with duct tape and tin foil. Perhaps this would be the
most economical solution for Yugo owners to use. Like the Yugo,
gel-cells and NiCads have plenty of problems and headaches that are
very well known to users of handheld radios. Like, for instance, the
fact the Gel-Cells last only a small fraction of their quoted lifespan.
You will go through at least five or six Gel-Cells to match the life of
my battery. Now use your calculator and tell me which is "cheaper", and
don't forget to factor in the time and aggravation of shopping for
them, re-wiring the unit, etc.

And don't forget to try and charge your Gel-Cell from your car socket!
I want to see that trick, but from a distance.

The NiCad "memory effect" I mention has been the bane and the
heartache of millions of users of NiCad powered devices, including
aviation radios, cel-phones, laptop computers, and I believe all kinds
of amateur radios. Whatever the technical name for this problem is, it
exists and it is a major concern of most users of these devices. This
is why the Lithium Ion, Nickel Metal Hydride, and other technologies
were developed. These new batteries have advantages and disadvantages
too.

My product is a very useful item that offers the most user friendly characteristics, is of the best quality, and lasts the longest. If this is of no interest to the readers of this newsgroup then I apologize and I overestimated their need for good quality products. But I do not believe this is true and I will wait to see if the majority of this group agrees.

Hello all,

They're finally approved by the FCC and released for domestic sale, and we've got them boxed and ready to ship to you.

ICOM R10 Handheld receiver. Price $489 + UPS

Powered by 4@ AA Alkalines. No rechargeables or charger available nor contemplated by ICOM at this time. You may use your own AA nicads and charger.

Unblocked or cellular blocked same price. Unblocked to government or legitimate users only.

We can take your check over the phone and ship immediately.

Limited initial stock going quickly so don't wait. Please pass the word.

Call 0900 - 1700 EST weekdays only.

Do you need Frequencies for your area. I have written a database search application to search the FCC's current frequency database. The database contains ALL FCC authorized frequencies. The data at the moment is current as of January 14th. I am offering a service for 3$. I will send you via email your states data. or for 2$ your cities. So basically $3 per state and 2$ per city.. Be prepared for a LARGE file. Seattle's file was 10,000 lines long.. It contained everything from Fire, police, McDonalds, to hospitals. I can send these files Via Snail mail too. for an extra 2$ on disk. I'm not trying to make money on this, just trying to cover costs. I was amazed by the information I obtained.

Email me if you have any questions.

rjmaas@nwlink.com

Otherwise here's my address for requests.

HOW TO MODIFY YOUR ICOM R7100 TO PROVIDE AN OUTPUT DIRECTLY FROM THE DISCRIMINATOR - WRITTEN BY TIM JACKSON tim@pixie.co.za

This is an involved operation and should NOT be attempted by anyone who
does not feel at home with fine electronics work. It is very easy to do
serious damage to your radio if you don't know what you're doing.

Please read through this document in its entirety before attempting to carry out the modification.

It is almost essential that you print this out in order to have it handy
while carrying out the modification. The diagram at the end of the article will be of great use.

Right, let's get down to the nitty gritty.

You are going to need just one electronic component - a capacitor of a value of between 220n and 10u. It can be either polar or non-polar. In addition, you will need a length of screened audio cable, any type should work but the smaller it is the better. You will need some form of
connector to put on the one end of the screened lead - a minijack socket
or phono connector would be good.

Of course you'll also need a few basic electronics tools such as a screwdriver, soldering iron, sidecutters etc.

With the front panel of the radio towards you, as you would have it for
normal use, locate the four retaining screws on top of the top cover.
These are located near each corner. Remove these four screws.

Do not remove the three screws located around the speaker grille.

On each side of the radio are two further retaining screws (a total of
four). Remove these.

The top cover may now be lifted off the radio taking care to observe the
speaker cable. The speaker is fixed to the inside of the top cover.
There is a connector in the speaker cable which should be unplugged to
free the top cover completely.

Looking down on the receiver, locate the converter unit. This is the PCB
closest to the external antenna connector at the left rear of the
receiver.

Now locate the coaxial connecter at the extreme left rear of the
converter unit PCB (see diagram). The cable connected at this point
bends over and travels downwards into the bottom half of the receiver.

Disconnect this cable by pulling directly upwards. The connector is
farily delicate so do not use too much force.

Now comes the part that requires great care. Take it slowly and do it
properly.

The entire top chassis has to be detached in order to reach the main
unit PCB beneath.

There are four screws that need to be removed to accomplish this. Two of
these are located on the rear panel of the receiver.

Looking at the radio from the rear now, you will see a row of connectors
for such things as external speaker etc. Just next to each end of this
row of connectors are the two screws you need to remove. Remove them.

The remaining two screws are on the top of the unit. Position the radio
as you had it before (normal operating position).

Looking down on the radio, you should see four screws near the front.
Two of these go through the top of the plasic front panel and two of
them go through the metal chassis (see diagram). Remove the two screws
that go through the metal chassis.

Now CAREFULLY lift the top chassis and swing it clear of the radio. Note
that there are many wires linking the top chassis to the bottom. Take

care not to strain these. there should be enough slack (just) to allow you to swing the top part out and away from the bottom and lower it onto
the surface you're working on.

Now you should have a clear view of the main unit PCB. This is where you
will be making a connection.

In order to locate the point on the PCB where you will connect the screened cable you will need a ruler or tape measure.

The connection point is approximately half way from the back to the front and approximately one quarter of the way from left to right. This
is just to give you a general idea of where to look. (see diagram)

Now, using your ruler, measure inwards 55mm (2 1/8") from the left edge
of the radio towards the right. Imagine a line running through this point from the front of the radio to the back.

Now, measure 120mm (4 3/4") from the rear towards the front along the imaginery line.

At this spot on the PCB (see diagram) you should see a wire link marked
"W100". This point (the wire link) is output of the discriminator.

Connect one side of the capacitor to this wire link. If the cap is a polar type then the positive lead goes to the wire link.

Connect the remaining lead of the cap to the centre conductor of your screened cable.

The screen of the screened lead can be soldered to the casing of the nearest metal can. There is a suitable can approximately 10mm (3/8") to
the rear of the wire link (see diagram). Take care not to overheat the can while doing this. You should be able to get the solder to flow nicely onto the can within two or three seocnds.

Exactly how you terminate the other end of the screened lead is up to you but I would suggest that you extend it through a suitably drilled hole in the rear panel of the radio and then terminate it on an in-line
mini jack socket or phono connector.

That's it! Well, almost. Now you have to reverse the whole process in order to close up the radio again.

Be extremely careful not to strain any of the wires and take care to ensure none are pinched between metal chassis parts as you close up the

radio.

Don't forget to reconnect the coaxial lead at the left rear of the radio
once the top chassis is back in place.

The new output you have created is basically just "raw audio". It is the
point in the circuit before audio filtering, volume and squelch control.
This means that it is a fixed level output unaffected by the position of
the volume and/or squelch controls.

Be aware that while short circuiting this output shouldn't cause any
harm at all, it will deprive the radio of an audio output thus muting
the internal loudspeaker. The impedance of this output is around 10k
which is perfect for driving the circuit supplied with the software
PD.EXE (a pager transmission decoding utility) but may require buffering
if you plan to use it for other purposes.

Anyone requiring further assistance is free to Email me at
tim@pixie.co.za. I'll do my best to help.

This diagram shows the relative location of various key points within
the receiver. Be aware that the points shown are all inside the radio
and that some are visible only once the upper chassis has been
removed.

Does anyone know what the frequencies are that are used byt the Rangers
in the Shenandoah National Park, including the hiking trails?
I would also like the split, and pl tone info, if possible. but any info
would be helpful. (I am not sure if they use repeaters, but the probably
do.)

> sides of that unit.
> andym@nmex.com.

1. It's slow compared to my other scanners (only around 15 cps vs 50+
on my other scanners).
2. You can't scan more than one bank at a time without "linking" banks
together. However with the slow scanning speed, you probably don't
want to scan more than one bank at a time.
3. Setting the squelch seems more difficult than on my other scanners.
4. There is no lock-out review. You must manually hunt for locked-out
frequencies. This is kind of a pain when the control channel jumps
around.
5. In general it is more difficult to use (especially when driving down
the
road) but I guess that can be expected with all the features it has.

How to Use the FTP Server at ATTENTION to Details BBS
-----------------------------------------------------
The ATD BBS FTP Service is offered as a cost-effective means to obtain
information and files from our Bulletin Board System (BBS) - using
Internet E-Mail as the method of exchange. Using our FTP Server is as
simple as addressing an Internet E-mail message to

ftp@atdbbs.com

containing one or more KeyWords. Multiple KeyWords can be combined in
a single Message - but it is very important that there be only ONE
KEYWORD PER LINE!

EXAMPLE: You see from the above list of KeyWords that you want a copy
of our textfile on NiCad batteries and our Help file. Address your
Internet E-Mail...

TO: ftp@atdbbs.com
SUBJECT: [anything here is OK]

...and write the corresponding KeyWord, NICADS, as the ONLY word in the
FIRST LINE of your message. And write HELP on the SECOND LINE of your
message. That's all there is to it!
```

If I could have only one scanner it would be the AOR AR8000. BUT it is
not perfect.

Known Problems:

Wandering Birdie problem makes 10mHz+ wide searches impossible, you run
out of PASS channels and you still have birdies (There is an "easy" mod
to fix this and I have done it, but why shouid I have to modify a $600
receiver to be able to use the search feature!)

Audio clipping, I don't run ito this problem very much on the HF and UHF
milair freqs. and that's what I use the AR8000 mostly for. (There is
also a mod for this, but I have not done it.

Slow scanning rate about 25 to 30 ch per sec. as compaired to 50 to 100
ch per sec on the newer Bearcats and Radio Shack models.

An excellent reference for the problems and mods is:

http://www.mich.com/~eddy/works/AR8000Tips.html

Hope this helps, Steve

It might. Concentrate on achieving as much height as possible - that's most important. Next a vertically polarized yagi withh the best coax you can afford will give you the best shot at NYC's Finest. Try these first. If no sucess, THEN try a preamp. Hobbyist preamps might introduce unwanted signals into your scanner's front end that may reduce you radio's sensativity. Then again, depending on your location, the preamp may not interfere. Try to do without the preamp, if you can.
Just my experiences, you mileage may vary :-)

GET AN UNLISTED PHONE NUMBER?!? What kind of a jackass reply is
that?! This dispatcher has an excellent point and makes sense. Plus anyone
that would call 911 to waste time with rediculous questions and comments is
a moron.
I heard a shooting go down last night in Newark NJ and this dispatcher had his
hands full during a tense situation. He had to co-ordinate EMS, Robbery, Crime
Scene, Homicide, SGTs, LT's, and Capt's calling in. Units responding, crowd
control, give locations, file numbers and times. Then the Cnty. Prosecutor and
of course IAB needs to get invoved. He did a great job and never sounded
flustered. He even found time to complement others for a good job. I don't
know how some of these guys keep it all straight. Give Em' a break.
Phil

1664. ****LOOKING FOR BEARCAT 100 INFO\OPINIONS\MODS********

Source record: 207670

Hi,

I am a proud owner of the first programmable scanner ever made-- The Uniden Bearcat 100. This is a 16 Channel scanner with basic VHF-LOW/VHF-HIGH/UHF coverege. This is my first scanner which I bought for $5 on a yard sale. (Hey, when your 13, you have a pretty tight budget when it comes to radios) I was just wondering what other people think of it. Also I want to know if there is any way to enable the 6 meter band (50-54 MHz) or the Air Band (108-136) which this scanner seems to lack.

Thanks,
Eugene

You're both full of shit. Name one national chain of retail stores where the employees know more (on the whole) about scanners, and I'll eat my Pro-60, NiCd's and all. They are required to pass a test on their knowledge of communications devices. I know, because I took and passed the test three years ago. They're not scanner geeks, but they can speak more intelligently about scanners than any sales staff in the country. Besides, there are other things in a RadioShack store besides scanners and they have to know a little about one hell of a lot of things.

OK, I can't resist throwing this one out there after seeing all the confusion over the "memory effect" :)

I thought I've heard before that any battery can be recharged. You just have to use a VERY low wattage to do it safely. I.e., a matter of days, instead of overnight, like a common recharger.

Of course, I would not want to subject my scanner to such an experiment, just to save a few bucks on batteries...

I think we should take this very seriously. As inane as it might sound, writing your congress people to resist such laws would be a good idea. Outlawing scanners is tantamount to handing over frequencies to selected industries, which is contrary to the notion of what the air waves air: a public trust administered by the FCC. Why do people have licenses, not ownership?

Are they going to go house to house to search for radios, like the NRA has suggested the government will do to confiscate guns?

So, in this society it can be free speech, but not free listening?

In message <Pine.A32.3.95.970208233215.2399D-100000@freenet2.afn.org> - "Todd L. Sherman" <afn09444@afn.org>Wed, 12 Feb 1997 19:37:14 -0500 writes:

The following exceprt of words appeared in an advertisement in the
Gainesville Sun, bottom of page 7A, Feb. 08, 1997.

"YOUR CELLULAR PRIVACY IS _OUR_ CONCERN.

ALLTEL Mobile and the CTIA (Cellular Telephone Industry Association) are totally commited to ensuring complete privacy for all cellular phone users. Together we are doing everything in our power to minimize the risk of eavesdropping on cellular telephone transmissions, and to toughen existing laws governing this offense. Intercepting cellular phone conversations is currently a violation of Federal and state law and we believe that anyone guilty of this crime should be prosecuted to the fullest extent of the law. To aid us in making this crime less likely, and the punishment more severe, we urge all cellular phone users to write their congressional representative and express concerns about this important issue."

I'd like everyone to note the words "totally committed to ensuring complete privacy" and "we are doing everything in our power to minimize the risk of eavesdropping".

As I see it, there is only ONE WAY to make good on this apparent "promise" to their customers...to make all scanning illegal period, and to remove all scanners from public hands. UNLESS, of course, they're planning on recalling all analog cellulars and replacing them with digitals at no cost to the customer. Plausible? ....NAHHHH!

Should we be worried right now what these guys are really going to be up to next very soon in Congress? What exactly do they plan to do to make good on their promise? How do they expect to make good on their promise? by written means? or by stomping out scanner "competition" altogether?

I have not been following this thread so forgive me if this has been said before.....
About two years ago I read somewhere (Pop Com ?) that NASA had owned up to starting the whole memory effect thing as the only available explanation for part of a mission failure.
They admitted that they had since discovered the "real" reason for the failure and were of the opinion that the memory effect theory was not valid.
At least that is how I remember it.

I have been looking to buy my first scanner, and have been considering the AR8000. I had planned to buy this from a foreign source to get cellular capability. Now i am not understanding what bandplan is or how this may affect preformance if used in the US. Could somebody with more knowlege about this hobby please explain what bandplan is and what is means to scanners, and how would somebody get a scanner reprogrammed if it was bought from a foreign source, if it would not work crorrectly right out of the box ?...?
Thanks for your knowledge and assistance to a beginning scanner hobbiest.

New product announcement... Dura-Pack portable rechargable power supply for all handheld radios, scanners, CB, etc!

Dura-Pack is the intelligent solution to your portable electronics power problems! Run your handheld radio up to five times longer than a standard 500 mAh NiCad! Say goodbye to NiCad "memory" problems forever. Say goodbye to spending $5.00 to $20.00 on alkaline cells each time you "recharge".

Dura-Pack will power any handheld electronic devices that have or have available a car adaptor plug. Dura-Pack recharges right in your car in about an hour or so, and requires NO separate charger. Forget about six hour or overnight charging. It supplies 12 volts and 2.5 ampere hours through two standard automotive cigarette lighter sockets. It weighs less than three pounds, measures only 8 x 2.75 x 1.75 inches. Comes with nylon case and belt loop. Includes car charge cord that stows in the case.

Dura-Pack is made with aerospace quality, mil-spec sealed cells that will not offgas, leak, or require any maintenance. It is NOT a cheapie NiCad, Gel-Cell, or lantern type battery. It does NOT develop a memory, it does NOT need a special delicate charge cycle, it does NOT need "cycling" or discharging to maintain its performance. Charge all at once, or in little bits. Lasts over 2000 cycles, not the 200 real world lifespan of NiCads and Gel-Cells.

This is the ultimate power source for emergency kits, mobile communications, field use, or backup power you can count on. Made in the USA. Retail is $129.95 including shipping in the lower 48.

Please feel free to Email or call for more information before you buy! For your security and peace of mind, either checks COD orders are available.

Nearly every state I know of (that has a scanner law) SPECIFICALLY allows for reporters to use scanners. This is an understood, known fact of covering breaking stories to let the public know and noone is trying to hinder them from that.

HOWEVER, where the concern lies is with unscrupulous insurance adjusters and lawyers trying to beat the next guy to the punch in thier businesses by harassing the poor victim of damage, pain, and/or suffering by using the scanner to swoop down upon them to effectively make a "sale." This is NOT "kindness" or "care" for an individual. It is furthering of business endeavors. This is what I was appalled at. This thread is starting to bend off the trail a bit.

BFD. A plain old lead-acid gel cell, available all sorts of places at
a fraction of that price.

Oh, and by the way, dude, there is no "memory effect" in nicad
batteries, so including that in your advertisement is misleading.

I originally asked for the mod to use the radio at auto races. I know a mod exists for this, but was looking
for someone who had done it.

An external amp is out, the earphone INSIDE "Saf-Ear-Sheilds" (28 db reduction) is still tough to hear.

I can only comment on the Pro 2006. Before I chose to sell it, I had my 2006 for about six years, and not one minute in the shop.
With care and a certain amount of protection, it's hard to say what the life is for one of these. Onlt to say, that the life of six years, only scratches the surface of what you can expect.
As far as handhelds, you have one constant drawback that negetively effects it's life. That being the chance of dropping it is about 100 % more likely that the 2006 or any other base model. The odds of that handheld damage from dropping depends of course on all the factors, envolving a plastic case surrounding a circuit board.

> scanner over seas just for cell coverage when the us model can do it?
> Please help me out even if just some answers THANKS!

You would need three things to make it computer controllable:

1) Interface (CX12AR, EDCO interface, Optolinx (if you can find them!))
2) Cable (The FFC that is standard sucks...I made my own connector)
3) Software.

I'm only now getting into computer control of my AR8000. I primarily use Macintosh computers and was using the EddyWorks AR8000 ToolKit for management of my AR8000; this worked fantastically, and he's now working on full computer control as well.

However, I also just bought Scan*Star for Windows Plus from Signal Intelligence; this has better computer control for scanning than the AR8000 Toolkit (at present at least) but I've found it to be remarkably unstable on my Dell PentiumPro running Windows 95...I get lots of crashes some so fatal that I have to hard reset the machine. I'm going to give it a bit more time, but right now I'm not happy with it...patience though I suppose.

I think it's a fantastic scanner...I'm really happy with it for mobile/handheld scanning. Using a simple radio shack FM transmitter I pump the sound through my car and listen to the local Police from all speakers. :-)

Let me know if you have more questions about the unit.

Scott

The whole laptop anecdote is just that: An anecdote. I can't argue much because there really isn't much data. You didn't present any charge/discharge voltage graphs. So no-one can really argue either case.

This is interesting John. I've seen stuff like that happen too. What I can't figure out is whether this is due to one or two weaker cells of a multi-cell pack not getting a full charge, or whether this is due to all of the cells exhibiting some kind of "memory." I tend to believe the former case, but I can be easily swayed.

Did you happen to measure the voltages across each cell while charging or discharging? If so, what were they like?

The bottom line is that everyone so far has been talking about NiCd cell packs --not the cells themselves. I think there is a cell pack phenomenon independent of the actual cell characteristics. Could that be the real "memory" culprit?

>Suggestions?

Depends what you mean when you say "build one from scratch." I've
seen some interesting articles which could be used as an IF and mixer
stage for some really cool scanners. The tough part would be building
the Local Oscillator(s) and the switchable front end filtering, and
then programming a microprocessor to run the show.

One could make a kit for this sort of thing, but it would cost at
least as much as a regular scanner. And I don't see why the existing
silly laws wouldn't apply to a kit just as easily as they do to a
manufactured scanner.

Nice idea, though. If there were such a thing out there, I might want
to try building one...

Yes, that's why it's a good idea to buy a extra battery pack for it.
They usally run about $30.00 to $40.00 depending on where you get it
from.

those alkalines can be recharged in a recharger which
is made for this kind of battery... I have had mine for
two years and recharge my alkalines over and over again.

One point: THEY DON'T RECAHARGE UP TO FULL as if new.
so to use them in my camera flashes would get me about
four flashes. maybe six.

But using these recharged ones in my pager and in my
tv channel changer works great. Low use=output here
and the batteries last for a long time. not compared
to normal, go out to buys, because these will last
for three or four months.

Point: alkalines work from being recharged, but on a
less-than "new" basis.

I use two recharged A's to power my battery clock...
as long as they are low-drain they work great.

saves a lot of money.

But then too I must have about thirty nicad AA/AAA's
and use these more....for higher usage demands

Probably just trying to help. I've lived in two cities (Fayetteville, Ark, and Norman, Okla, both of which have "centralized" dispatch) where this is a routine occurance. I've never called in to correct them. The Battalion Chiefs usually take care of that. And they never sound happy about having to do it.

> People that call in to ask details on calls. If the call really is
> "intense", I am probably as busy as can get with alarms and stuff...

No one has any business calling *you* for information, scanner listener or not, let alone on 911!! What an embarrassment to the hobby.

Peter

1700. Congress and the Scanning Debacle

Newsgroup: rec.radio.scanner
Date: 1997-02-13 00:00:00 UTC
From: druth@kdcol.com
Message-ID: <3303527b.3852253@news.apeleon.net>
Source record: 207706

In my opinion, the issues are very complex, and they involve much collusion and cabal even independently of the scanner industry.

Perhaps, first and foremost, one needs to ask: who owns the rights to the air? Who owns, by legal mandate, the atmosphere about us, and, in particular, the air within a human organism's immediate proximity? The air is the sole medium for this form of communication. If you own your own home, your real-property rights include all of the earth UNDERNEATH the ground that is within your boundary lines, and ALL THE AIR SPACE UP ABOVE! If you'll look into real estate law, you'll find this to be the case.

As someone with only mild environmental concerns, I am yet outraged that my physiological body is even this instant being bombarded with virtually every frequency of man-made electromagnetic radiation -- and some not man-made as well. It doesn't matter which room I go to in my house, it doesn't matter if I hide in the closet, or hide underneath the coffee table, or even lock myself in the attic. Wherever I am, I will be able to run a television, radio, scanner, cellular phone, and more. We are all veritable electromagnetic "pin cushions" who walk through perpetual and invisible walls and planes and spheres of a plethora of radiating frequencies.

And who was the derned fool that even said that cellular technology was SUPPOSED to be private? Who? Why should it have been? Did it HAVE to be? Who weilded such great power over the cosmos to insist that the advent of cellular technology be synonymous with cellular privacy? Who? Cellular technology could have simply been implemented for safety purposes -- and citizens WOULD HAVE been damned happy to let it be at that. So who made these brazen claims that the advent of cellular technology necessarily implied cellular privacy? Who was it that legislated that the citizenry no longer had inalienable rights with respect to the air within their own arm's reach?

IT WAS THE CELLULAR INDUSTRY WHO LIED, THAT'S WHO!!

The cellular industry, in order to make gobs of money, paid congress ("paid" is such an ugly word; shall we say "persuaded with green pictures of George Washington") to slap together some ineffectual contrivance of legislation with less-than-robust wording (after all, surveillance is the government's "tender" spot -- not to be tampered with too harshly) so that the cellular industry could tell their customers:

"Looky! We have singlehandedly and without due process claimed all rights and privileges to each person's air space! So now, you see,

you starstruck ignoramouses you, your conversations are private because it is against the law (if you don't read the legislation too rigorously) for a "bad guy" to listen; and furthermore, Mr. and Mrs. Cellular Customer, as we know from the past, 1) ineffectual wording in the law is irrelevent when prosecuting, and 2) when something "seems" against the law, then no one will break it! You're covered you hapless saps of credulity! (and then aside): "Oh, and would you please just sign this contract and give me your check."

The scanning industry was like an expository machine. The government and the cellular industry were in collusion -- at the expense of citizens who were without technological expertise! This gave the scanning industry an inherent, albeit not unrewarding, "duty" to push an ineffectual and ambiguous law to its limits, while being paid for its services rendered -- to the unwitting public!! The scanning industry has actually been a great service for the public. The results have now served the original purpose, which are, and with the respected corporate undertones:

The cellular industry has been exposed for lying to its customers; the government has been exposed for its collusive involvement; and the scanning industry has NOT been exposed so much as it has served its purpose as an expository machine. Its duty is virtually "finished"; the cabal, collusion, and ulterior motives are exposed and out in the open, yet the scanning industry is postured as the scapegoat to protect the government. Hah!

From the beginning, if the cellular industry would have said to its customers, "Look, this is new technology, but no one owns the airwaves, so please sign this paper stating you understand that your conversations are not private," then nobody would have been hurt, and the business STILL would have flourished.

And for another topic at another time:
Was it the government who early-on suppressed the cheap and affordable digital technology? After all, encryption starts sounding like PGP, which the government does not appreciate at all.

Anyway, my rant is over.

Doug

At a guess, this sounds like the department is operating half-duplex,
i.e. both dispatcher and mobiles use the same frequency. The dispatcher
can hear the mobiles clearly due to a high antenna and sharply tuned rcvr.
More important, however, is the frequency you cite. That falls in the
middle of the VHF mobile phone / pager allocation in the U.S., and is off
frequency at that (157.890 and 157.920 would be legitimate assignments).
While this band may have been recently re-assigned, I suspect you don't
have the actual PD frequency.

It's just 'feel good' speak from ALLTEL. I certainly am not too
concerned about
the existing 'law' being enforced, or about the scanner police coming to
get
my scanner.

What would you expect ALLTEL to say in response to the Newt Incident?!
That they

have the problem under control? They can only carry the premise so far...

I am just getting back into scanning after a 4 year hiatus. I have an hour+ commute now and want to set up a scanner in my vehicle to break the monotany.

Please give me some input as to a decent scanner/antenna combination that won't set me back a fortune ($250 range maybe?). Also, have seen antenna splitters that work in conjunction with the AM/FM radio-- any good?

Thanks in advance for the .02's!

Memory problems in ni-cad batteries are possible, but they are hard to duplicate even in laboratory-controlled circumstances. It is not that big of a problem in every day use, but it is possible. He is not necessarily misleading the public by saying that, but advertisers have been trying to scare the public for years by referring to this rare condition. I get a kick out of listening to hams on repeaters who say things like, "I hope this battery goes soon! I can't go to bed until it's all the way run down before I charge it! I don't want to have 'memory' problems with it tomorrow".

Hello,

I am looking to buy a used portable scanner, that has been modified to 800 and 900 mhz. I was also hoping for a shortwave mod.

I know 800-900 mhz is illegal but just want this capability. I have a set of lockpicks and don't go around breaking in all day, just something fun to do at parties. =)

Please let me know if you are looking to sell the above scanner and why you are selling it. I have the money to spend for the right scanner that does not have any major problems.

Thanks

This freq is in the band adjacent to the 2-meter ham band where MARS
stations operate. Probably a military phone patch repeater. These
repeaters use a wide offset, and typically go in on one side of the ham
allocation and out on the other.

Yes you can listen in on 900 Mhz phones. I have a 900 Mhz phone and I have a scanner that can pick-up it's signal. My scanner can also pick-up my cheapie portable phone. If you want to try - set your scanner's search limits between 46 and 49 Mhz ranges. Bottom line - never discuss over the phone, portable/cell/or line, what you don't want anyone else to know.

1722. Q: How hard is it to build your own scanner?

Newsgroup: rec.radio.scanner
Date: 1997-02-13 00:00:00 UTC
From: ckraft@airmail.net
Message-ID: <5dtvb3$v83@library.airnews.net>
Source record: 207805

With all this talk about modifying scanners to pick up cell freqs, I am beginning to wonder. Why not build your own 800 Mhz scanner? How hard could it be? It seems to me (and I don't know a whole lot - that's why I am asking the question) that you could take an AM or FM radio kit or something similar and replace the crystal with one that will pick up the 800-900 Mhz cell freqs.

I can't imagine that it would take much to build one from scratch even. Does anyone have any schematics out there on the web? Suggestions?

you could have saved all of us the time and posted the following:

Parties that wish to file formal comments in these proceedings should
follow the procedures
set forth in the NPRM and NOI. General information on
filing comments with the FCC is also
available.

You may also file informal comments electronically
via e-mail to access@fcc.gov for the
Access Reform NPRM (CC Docket No. 96-262) and
isp@fcc.gov for the Internet Access &
Information Service Provider NOI (CC Docket No.
96-263).

Only one copy of electronically-filed comments must
be submitted. You must put the docket
number of the proceeding in the subject line, and you
also must note in the subject line if an
electronic submission is an exact copy of formal
comments. You also must include your full
name and Postal Service mailing address in your

submission.

Hi Rick,

Nope. R1, R100, R7000, R7100 and R8500 are (or were) all available in
either blocked or unblocked versions. All can be easily restored. R1
is a bit tuff due to the small size.

R7100 has been discontinued and no longer is available. All others,
including the R7000 (unblocked only) are still available from us or
any ICOM commercial dealer.

Unblocking instructions or services are *not* available from us,
although we will sell or service anything ICOM except amateur.
Unblocked receivers sold legally only.

What can I say? You're an idiot! You poor thing. That nasty old RadioShack scanner won't pick up television stations on frequencies outside the range of commercial television broadcasts. After all, that's what scanners are for, isn't it? Listening to television audio on the wrong frequency. I'd be upset, too, if I were stupid as you! What's your gripe with RS anyway; you prefer the geniuses at Circuit City, or maybe, (gulp) Best Buy?

:>It does look like a nice unit, except that it only scans at
:>6 channels per second, which is way too slow. It's a shame
:>that a radio that seems to be pretty nice otherwise has such
:>a fatal flaw.

In all fairness to the RC-10, I understand it has two tuners. The second tuner searches ahead for the next active channel while you listen to the last one that came active. In an active environment you'd immediately jump from one active frequency to the next. In a less active area the native scan rate would be a major hindrance.

I've got a Pro-60 myself and I have every local FM radio station and every VHF and UHF television station programmed into for the most crystal-clear reception I could possibly ask for. It might help if you set the unit to WFM mode, and it would definitely help if you tuned it to the frequency on which that station actually broadcasts on. The Pro-60 is triple-conversion, so you will not pick up broadcasts on the incorrect frequency as with your obviously inferior Bearcat.

So there!

I'm in need of someone with experience programming PROMs for
a Motorola 800 Mhz Traxar for a Motorola System II (8 channel).

If you can program up a PROM for me, I'd be happy to pay you
for parts and time!

e-mail me at:
ironstm@archives.gov.on.ca

Thanks!

OK. So if I see a plane go down, I shouldn't call 9-1-1. Thanks for
the tip.

On behalf of that confused citizen, I apologize. He *never*
should have bothered you with such trivialities. Again, sorry.

BTW, what city are you in?

I put the first resistor and capacitor inside my scanner, as close totgether as possible.

I put the rest of the circuit inside a DB25 hood (plastic) from RS.
I eliminated the 10k and 100k resistors in the feedback loop and connected the noninverting (+) input of the Opamp directly to ground.

This combination works fine for me.

If you need a good camoflaged antenna, try the Grove NO-Tenna. It works fine for me in all my scanner bands. The whole car becomes the antenna, it doesn't need to be visible at all.

cheers

1747. MDT frequency list

Newsgroup: rec.radio.scanner
Date: 1997-02-14 00:00:00 UTC
From: hh357@aol.com
Message-ID: <19970214163300.LAA19167@ladder01.news.aol.com>
Source record: 207481

Like other interested parties, I have found it difficult to find MDT (digital) frequencies. Therefore I have compiled the following list of what I could find.

So far, except for the Ardis network, all of these frequencies are for Southern California.

If anyone has other frequencies, please email them so that I can add them to the list.

If you have further information, especially if you can identify MDC4800 systems, please email me. I will re-post the list occasionaly as it grows.

All states and countries welcome.

H Higgins

City, etc Frequency Notes (1)
------------ -------------- ---------------------------
ARDIS network 855.8375 nationwide
Anaheim 855.4874
Arcadia 868.6375 PD/FD
Beverly Hills 868.8375 PD/FD
Costa Mesa 855.9875

Culver City 868.9625
Downey 868.9125
Escondido 864.1500
Garden Grove 858.3375
Hawthorne 855.2375 various So. Bay

Hermosa Beach 855.2375
Irvine 866.0750 PD

470.8125 470.8375 470.8625
470.8875 470.9375

LAPD 159.18 159.15 non-motorola
158.91 158.865 (see note 2)
159.03

LAX 855.2375

Long Beach 45.1 old
860.2375 new
868.6625 FD

Orange 867.45 867.4500
Orange County Transit Auth. 856.4875

San Diego 856.0750 857.0750 858.0750
859.0750 860.0750 861.0500
861.1000

Santa Ana 868.4500
Santa Barbara 857.4625
Santa Monica 868.8875 (3)

NOTES:

1. All MDT systems are included. As the Manufacturer or protocal is identified the list will be updated to reflect this information.

2. Not a Motorola system. Believed to be a system made by System Development Corp. (SDC) in Santa Monica about 1976. Most of what's left of SDC is now part of Unisys. These are the repeater frequencies only.

3. Not a Motorola MDC4800 system. Origin unknown.

I normally bury my scanner undeneath all the cables and spare batteries in my Mac PowerBook carry-on bag. I only had it confiscated once - in Frankfurt airport. He must be the most conscientious x-ray driver in the world. He put in in a jiffy bag and walked it to the departure gate, where the gate crew walked it on to the plane and gave it to the cabin crew, who handed it back to me.

Re your enquiry regarding the Yupiteru series scanners, I can only add to the comments that have alrerady been supplied, to say that I have found them really good value and they give excellant service!!

I started with the early MVT5000 then progressed onto the 7100 this was a fine scanner and a really good all rounder for just about everything. I was so impressed that I traded this in for a MVT7200 which I think you will find is the best available so far. The reception on HF is better than half-way-decent for the facility in a hand-held. The HF performance of the 7200 is much improved over the 7100, so if you can source one of these, this is the one to go for.

I also own an AR800 which also has some lovely additional features over and above the 7200, however the HF performance is nowhere near as good. Of course the 7200 lacks the alpha tagging which on a busy scanner can be a useful asset, however in my personal opinion the 7200 comes out on top nearly every time. The 8000 also features smaller momory banks - being 20 X 50 rather than 10 X100 on the Yupi, this does make storage a little easier, but at the end of the day you still have 1000 memories. Can you live with this ?

More importantly I have never found the front end of the Yupi overloads and I run mine mainly as a base station (more so in the winter months) using a nest of diapoles on a mast. Overloading ? no problems at all. All round reception, brillant !

Powered by 4 X 1200ma AA Cells, seems to work forever, certainly get a whole nights scanning out of a good charge.

I have seen and pondered over the latest 9000 model, however I think you should wait for the time being. Firstly the first production models microprocessor 'locked-up' after a brief usage. I am sure

Yupiteru will quickly sort this trouble out, however the price of a 9000 is significantly higher being a newly launched scanner.

Really I don't think the price justifies the few extra features that the 9000 offers. Always a hard choice spending a large chunk of your pocket money on a hand-held, but I am absolutely sure your won't be disappointed with a 7200.

Go On - Go for It !

Regards & Best Wishes to you.

> andym@nmex.com.

Andy -

The only complaint I have about said unit is the questionable SSB
shortwave reception - even hooked to a 90-foot longwire it was
skeptical, to say the least. But, like most, I didn't purchase it for
the shortwave radio features, so I wasn't overly disappointed. The 8000
is still the best portable scanner money can buy, in my book.

I'll bet that their problems is not 'memory effect', but something else due to misuse of the batteries. The chief problem is overcharging. People forget to take their batteries off the charger and they severely 'out gas' them. Memory effect is possible, but very rare. You have to charge/discharge the batteries at exactly the same rate and interval hundreds of times before you see it occur. Satellites develop this problem with their batteries because they are subject to exactly the same charge/discharge rate every day. You have to duplicate this situation in a laboratory to see it happen here. It is very rare for this to happen in every day consumer use. Manufacturers of battery products just love to scare the consumer with this possible scenario, but it rarely happens!

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. 6 AM. Admission $5.

Talk in 146.52 MHz. Contact Bob Grosse, N9KXG. Info (voice/fax) (847)658-1678. http://www.angelfire.com/il/tcrg/ (Smaller, but fun fest. - AJ9S)

SEPTEMBER 1997

Sep 27 and 28 (Sat & Sun), Grayslake, IL - CFMC's Radio Expo 97. Lake County Fairgrounds, Rts 45 & 120. Admission $6. Talk in 146.76 MHz. Info (708)457-0966. (This is probably the biggest and best hamfest in N. Illinois - AJ9S).

NOVEMBER 1997

Nov 15 & 16 (Sat & Sun), Fort Wayne, IN - Fort Wayne Ham-fest. Indiana ARRL State Convention. Allen County War Memorial Coliseum Expo Center. Sponsored by the Allen County AR Technical Society. Admission $5. Parking $2. www.pipeline.com/~dagagnon/. Info: (219)484-1314.

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123.

Don't know if this applies to the SC150 or not, but on my BC205 I use a lapel speaker, on previous BC205 it was fine, but on the last one I got the volume was low.

The mod to increase the volume is to take a small piece of wire and run it from the antenna ground to the headphone jack ground.

1756. Introduction to Scanning

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can

listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these | frequencies. It's clear from the discussions posted on the | Internet that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is illegal for companies to sell or import into the USA | recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in

semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the

action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, | transmit either CTCSS or DCS signals subaudibly along with | the voice information.

There are over 40 different CTCSS codes and you can program | a specific CTCSS or DCS code into each memory channel. * Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers | and other signals which are not transmitted with a | matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is | annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL | (Private Line), GE's Channel Guard, and RCA's Quiet | Channel. Motorola uses the tradename DPL (Digital Private | Line) for its digital coded squelch.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner

models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of the $2.00.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret

Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license

database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including | a beautiful 8-1/2" by 11" scaled color map, protected by | plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and

understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business,

- 2 -

sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an | electronic subscription to the CARMA Newsletter. For more | info, see:

http://members.gnn.com/shabec1/carma.htm |

The club's mailing address is: |

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio | Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot

on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.
